Britain. science was published almost in the same terms with the former; but with this peculiar injunction, that all divines should read it after service in their churches. The clergy resolved to disobey this order. Loyde bishop of St. Asaph, Kenn of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Tre-lawney of Bristol, together with Sancroft the primate, concerted an address in form of a petition to the king, which, with the warmest expressions of zeal and submission, remonstrated that they could not read his declaration consistent with their consciences, or the respect they owed the Protestant religion. The king received their petition with marks of surprise and displeasure. He said he did not expect such an address from the church of England, particularly from some amongst them; and persisted in his orders for their obeying his mandate.

As the petition was delivered in private, the king summoned the bishops before the council, and there questioned them whether they would acknowledge it. They for some time declined giving an answer; but being urged by the chancellor, they at last owned the petition. On their refusal to give bail, an order was immediately drawn for their commitment to the Tower, and the crown lawyers received directions to prosecute them for a seditious libel. The king gave orders that they should be conveyed to the Tower by water, as the whole city was in commotion in their favour. The people were no sooner informed of their danger, than they ran to the river-side in prodigious multitudes, craving their blessing; calling upon heaven to protect them, &c. The very soldiers by whom they were guarded, knelt down before them, and implored their forgiveness.

The 29th of June 1688 was fixed for the trial of the bishops; and their return was still more splendidly attended than their imprisonment. Twenty nine peers, a great number of gentlemen, and an immense crowd of people, waited upon them to Westminster-hall. The dispute was learnedly managed by the lawyers on both sides. The jury withdrew into a chamber where they passed the whole night; but next morning they returned into court, and pronounced the bishops not guilty. Westminster-hall instantly rang with loud acclamations, which were communicated to the whole extent of the city. They even reached the camp at Hounslow, where the king was at dinner in lord Eversham's tent. His majesty demanding the cause of those rejoicings, and being informed that it was nothing but the soldiers shouting for the delivery of the bishops; "Call you that nothing! (cried he); but so much the worse for them." Immediately after this, the king struck out two of the judges, Powel and Hollway, who had appeared to favour the bishops. He issued orders to prosecute all those clergymen who had not read his declaration, and all had refused it except 210. He sent also a mandate to the new fellows, whom he had obtained on Magdalen college, to elect for president, in the room of Parker lately deceased, one Gifford, a doctor of the Sorbonne, and titular bishop of Madaga.

As the king found the clergymen every where averse to his measures, he was willing next to try what he could do with the army. He thought if one regiment should promise implicit obedience, their example would soon induce others to comply. He therefore ordered

one of the regiments to be drawn up in his presence, and desired that such as were against his late declaration of liberty of conscience should lay down their arms. He was surpris'd to see the whole battalion ground their arms, except two officers and a few Roman-catholic soldiers.—A fortunate circumstance happened about this time in his family. A few days before the acquittal of the bishops, the queen was brought to bed of a son, who was baptis'd by the name of JAMES. This would, if any thing could at that time, have served to establish him on the throne: but so great was the animosity against him, that a story was propagated that the child was supposititious; and so great was the monarch's pride, that he scorn'd to take any precautions to refute the calumny.

Though the enthusiasm of James himself bordered upon madness, the most wild of his religious projects seem to have been suggest'd by his enemies to accomplish his ruin. The earl of Sunderland, whom he chiefly trusted, was a man of abandoned principles, insatiable avarice, and fitted by nature for stratagem, deception, and intrigue. The love of money was his ruling passion, and he sold his influence to the highest bidder. To such a degree was he mercenary, that he became at once the pensioner of the prince of Orange and of the king of France. The former, who had long fix'd his eye on the English throne, watch'd James's motions, and took every advantage of his errors. He had laid his schemes so extensively, that nothing but the birth of a male heir to the crown of England could possibly prevent him from an almost immediate possession of the kingdom. He had the address to render two thirds of the powers of Europe interest'd in his success. The treaty of Augsbuurg, form'd to break the power of France, could not accomplish its object without the accession of England. The house of Austria, in both its branches, preferred their political views to their zeal for the Romish faith, and promoted the dethronement of James as the only means to humble Louis XIV. Odescalchi, who under the name of Innocent XI. fill'd then the papal chair, was gain'd to the measures of the prince of Orange by other considerations, as well as through his fix'd aversion to France. The prince of Orange sent his intimate friend the prince of Vaudemont to Rome, to procure the aid of the Pope. He explained to his Holiness, that the Catholic princes were in the wrong to expect any advantage to their faith from James, as his being a declared Papist rendered his people averse to all his measures. As for himself, should he have the good fortune to mount the throne of England, he might take any step in favour of the Roman-catholics without jealousy; and he promised to procure a toleration for the Papist, should the Pope, the emperor, and the king of Spain, favour his attempt. This negotiation procur'd the desired effect. Innocent contributed, with the moneys of the church, to expel a Roman-catholic prince from his throne.

Though the contest with the bishops had complet'd the king's unpopularity, he deriv'd the suddenness of his ruin from the birth of a prince of Wales. That circumstance increas'd the fears of his subjects in proportion as it rais'd his security and hopes. In the reign of a prince to be educated under the prejudices of such a father nothing, but the circumstance of the same unconstitutional measures could be expected. So low indeed

subjects.

The prince of Orange, seeing the national discontent now raised to the highest pitch, resolved to take advantage of it. He began by giving one Dykevelt, his envoy, instructions to apply in his name to every religious sect in the kingdom. To the church-party he sent assurances of favour and regard; and protested, that his education in Holland had no way prejudiced him against episcopacy. To the non-conformists he sent exhortations, not to be deceived by the insidious caresses of their known enemy, but to wait for a real and sincere protector, &c. In consequence of these insinuations, the prince soon received invitations from the most considerable persons in the kingdom. Admirals Herbert and Russel assured him in person of their own and the national attachment. Henry Sidney, brother to Algernon, and uncle to the earl of Sunderland, came over to him with assurances of a universal combination against the king. Lord Dumblaine, son to the earl of Danby, being master of a frigate, made several voyages to Holland, and carried from many of the nobility tenders of duty and even considerable sums of money to the prince of Orange. Soon after, the bishop of London, the earls of Danby, Nottingham, Devonshire, Dorset, and several other lords, gentlemen, and principal citizens, united in their addresses to him, and intreated his speedy descent. The people, though long divided between whig and tory, now joined against their unhappy sovereign as a common enemy. William therefore determined to accept of their invitations; and this the more readily, as he perceived the malecontents had conducted themselves with prudence and secrecy. Having the principal servants of James in pay, he was minutely informed of the most secret actions and even designs of that prince. His intelligence came, through Sidney, from Sunderland, who betrayed the very measures which he himself had advised. The prince had a fleet ready to sail, and troops provided for action, before the beginning of June 1688.

282
By which
he is invited
into Eng-
land.

The king of France was the first who gave James warning of his danger, and offered to assist him in repelling it. But he declined this friendly offer, lest it should be said that he had entered into a private treaty with that monarch to the prejudice of the Protestant religion. Being also deceived and betrayed by Sunderland, he had the weakness to believe, that the reports of an invasion were invented in order to frighten him into a strict connection with France. He gave credit to the repeated assurances of the states, that the armament prepared in their ports was not designed against England. Nay, he even believed the assertions of the prince himself, whose interest it was to deceive. Sunderland descanted against the possibility of an invasion, and turned to ridicule all who believed the report. Having by the prior consent of James taken possession of all the foreign correspondence, he suppressed every intelligence that might alarm; and even all others whom James trusted, except Dartmouth, affected long to give no faith to the reports of an invasion.

their own defence. But this proposal met with no better reception than the former. Still Louis was unwilling to abandon a friend and ally whose interest he regarded as closely connected with his own. He ventured to remonstrate with the Dutch against the preparations they were making to invade England. The Dutch treated his remonstrance as an officious impertinence, and James himself declined his mediation.

The king of England, having thus rejected the assistance of his friends, and being left to face the danger alone, was astonished with an advice from his minister in Holland, that an invasion was not only projected, but avowed. When he first read the letter containing this information, he grew pale, and the letter dropt from his hand. He saw himself on the brink of destruction, and knew not to whom to apply for protection. In this emergency, Louis wrote to James in his own hand, that to divert the Dutch from their intended invasion of England, he would lay siege to Maastricht with 30,000 men. James communicated this intelligence to Sunderland, and he to the prince of Orange. Six thousand men were thrown into Maastricht; and the design of Louis, as being impracticable, was laid aside. On this, Louis, being disgusted with James, turned his arms towards Germany. The dauphin laid siege to Philipburgh on the 5th of October; and prince Clement of Bavaria, by throwing a strong garrison into Cologne, effectually secured the states of Holland from any sudden danger from the arms of France.

James had now no resource but in retreating from those precipitate measures which had plunged him into inextricable distress. He paid court to the Dutch, and offered to enter into any alliance with them for their common security. He replaced in all the counties of England all the deputy lieutenants and justices who had been deprived of their commissions for their adherence to the test and penal laws. He restored the charters of free corporations as he had possessed himself of; he annulled the high commission court; he reinstated the expelled president and fellows of Magdalen college; and was even reduced to carets those bishops whom he had so lately persecuted and insulted.

All these concessions, however, were now too late: they were regarded as the effects of fear, and not of repentance. Indeed, it is said, he very soon gave proofs of his insincerity: for, hearing that the Dutch fleet was dispersed, he recalled those concessions he had made in favour of Magdalen college; and to show his attachment to the Romish church, at the baptism of the prince of Wales, he appointed the pope one of the sponsors.

In the mean time, William set sail from Helvoetsluys with a fleet of near 500 vessels, and an army of above 14,000 men. Fortune, however, seemed at first every way unfavourable to his enterprize. He was driven back by a dreadful storm; but he soon refitted his fleet, and again set sail for England. It was given out that this invasion was designed for the coasts of France; and many of the English, who saw the fleet pass along their coasts, little suspected the place of its destination. It happened that the same wind which sent the Dutch to their place of destination, detained the English fleet in the river: so that the Dutch passed the straits of Dover without molestation; and after a voyage

of

Britain. of two days, landed at Broxholme in Torbay, on the 5th of November, the anniversary of the gunpowder treason.

But though the invitation from the English was very general, the prince for some time had the mortification to find himself joined by very few. He continued for ten days in expectation of being joined by the malecontents, and at last was going to despair of success. But just when he began to deliberate about re-embarking his forces, he was joined by several persons of consequence, and the whole country soon after flocked to his standard. The first person that joined the prince was major Burrington, and he was quickly followed by the gentry of the counties of Devon and Somerset. Sir Edward Seymour made proposals for an association, which was signed by great numbers; and every day there appeared some effect of that universal combination into which the nation had entered against the measures of the king.

This was followed by the defection of the army. Lord Culchester, son to the earl of Rivers, first deserted to the prince. Lord Cornbury, son to the earl of Clarendon, carried off the greatest part of three regiments of cavalry at once; and several officers of distinction informed Feverham their general, that they could not in honour fight against the prince of Orange. Soon after this the unhappy monarch found himself deserted by his own servants and creatures. Lord Churchill had been raised from the rank of a page, and had been invested with an high command in the army; he had been created a peer, and owed his whole fortune to the king's bounty: yet even he deserted among the rest; and carried with him the duke of Grafton natural son to the late king, colonel Berkly, and some others.

In this universal defection, James, not knowing where to turn, began to think of requesting assistance from France when it was now too late. He wrote to Leopold emperor of Germany: but in vain; that monarch only returning for answer, That what he had foreseen had happened. James had some dependance on his fleet; but they were entirely disaffected. In a word, his interests were deserted by all, for he had long deserted them himself. He still found his army, however, to amount to 20,000 men; and had he led them immediately to battle, it is possible they might then have fought in his favour. But James's misfortunes had deprived him of his natural firmness and resolution; and, seeing himself deserted by those in whom he thought he could have placed most confidence, he became suspicious of all, and was in a manner deprived even of the power of deliberation. In this extremity of distress, the prince of Denmark, and Anne James's favourite daughter, perceiving the desperation of his circumstances, cruelly resolved to take part with the prince of Orange. When the king was informed of this, he was stung with the most bitter anguish. "God help me (cried he), my own children have forsaken me." To add to his distress as a parent, he was accused of being accessory to the death of his own child. Her nurse, and her uncle the earl of Clarendon, went up and down like distracted persons, assuring that the Papists had murdered the princess. They publicly asked the queen's servants whether they had conveyed her? and they contributed to inflame the populace, whose zeal had already inflamed them to tumult and disorder. It was, however,

soon known that she fled, under the conduct of the bishop of London, to Northampton.

On the 30th of November 1688, James sent three of his noblemen to treat with the prince of Orange. But though the latter knew very well that the king's commissioners were in his interests, his behaviour showed plainly that he now thought the time of treating was past. For some time he would not admit them to an audience; and, when he did, would give no satisfactory answer. James now began to be afraid of his personal safety. But what most afflicted him was the terror of the queen for herself and her infant son. He therefore resolved to send them abroad. They crossed the river in a boat, at Whitehall, in a stormy and rainy day. They were carried to Gravesend in a coach, under the conduct of the count de Lauzun. A yacht, commanded by captain Gray, which lay there ready for the purpose, soon transported them in safety to Calais.

The king was now so dispirited and distracted, that he resolved to leave the kingdom at once, and thus throw every thing into confusion. He threw the great seal into the Thames; he left none with any authority to conduct affairs in his absence; and he vainly hoped to derive advantage to his affairs from anarchy and disorder. About twelve at night, on the 10th of December, he disguised himself, took a boat at Whitehall, and crossed the river. Sir Edward Hales, with another friend, met him at Vauxhall with horses. He mounted; and being conducted through by-ways, by a guide, he passed in the night-time to the Midway, which he crossed by Ailesford-bridge. At Woolcock he took fresh horses, sent thither before by Sladden one of his equerries who was in the secret of his flight. He arrived at ten o'clock at Embyferry near Feverham, where a customhouse hoy, hired by Sir Edward Hales, lay ready to receive them on board. But the wind blew fresh, and the vessel had no ballast. The master, therefore, easily persuaded the king to permit him to take in ballast at Shilnecs. It being half ebb when they ran ashore, they designed to sail as soon as the vessel should be afloat. But when the vessel was almost afloat, she was boarded by three sloop-boats belonging to Feverham, containing 50 men. They seized the king and his two companions, under pretence of their being rapists that wanted to escape from the kingdom. They turned up Feverham water with the tide; but still the king remained unknown. Sir Edward Hales placed privately 50 guineas in the hands of the captain, as an earnest of more should he permit them to escape. He promised: but was so far from keeping his word, that he took what money they had, under pretence of securing it from the seamen; and, having provided himself of their all, he left them to their fate. The unfortunate fugitives were at length carried in a coach to Feverham, and the insults, clamours, and threats, of the sailors. When the king was brought to the inn, a seaman, who had served under him, knee'd him, and melted into tears; and James himself was so much moved at this instance of his affection, that he wept. The other fishermen, who had treated him with such indignity before, when they saw his tears, fell upon their knees. The lower inhabitants of the whole village gathered round him; but the better sort fled from his presence. The seamen, however, formed themselves into a guard round him.

His Great
address.

him, and declared that "a hair of his head should not be touched." In the mean time, Sir James Oxendon, under the pretence of guarding him from the rabble, came with the militia to prevent his escape. The king found a change in his condition when he was taken out of the hands of the sailors. The commanders of the militia showed him no respect. He was even insulted by the common soldiers. A letter which he intended to send to London for clothes, a change of linen, and some money, was stopped by those who pretended to protect his person.

All things in the mean time ran into confusion at London, and the prince of Orange exercised in his own person all the functions of royalty. He issued a declaration to the disbanded army to reassemble themselves. He ordered the secretary at war to bring him a list of the king's troops. He commanded the lord Churchill to collect his troop of horse-guards. He sent the duke of Grafton to take possession in his name of Tilbury fort. The assembly of peers adjourned to the council-chamber at Whitehall; and, to give the appearance of legality to their meeting, chose the marquis of Halifax for their president. While this assembly was sitting, on the 13th of December, a poor countryman, who had been engaged by James, brought an open letter from that unfortunate prince to London. It had no superscription; and it was addressed to none. It contained, in one sentence only, his deplorable condition when in the hands of a desperate rabble. This poor messenger of their fallen sovereign had long waited at the council door, without being able to attract the notice of any who passed. The earl of Mulgrave at length, apprised of his business, had the courage to introduce him to the council. He delivered his open letter, and told the face of the king with tears. The assembly were so much moved, that they sent the earl of Feversham with 200 of the guards towards Feversham. His instructions were to rescue him first from danger, and afterwards to attend him to the sea-coast, should he choose to retire. He chose, however, to return to London; but the prince of Orange sent a message to him, desiring him to advance no nearer the capital than Rochester. The messenger missed James by the way. The king sent Feversham with a letter to the prince of Orange, requesting his presence in London to settle the nation. He himself proceeded to that place, and arrived on the 16th of December. Doubting the fidelity of the troops who were quartered at Westminster, he chose to pass through the city to Whitehall. Never prince returning with victory to his capital was received with louder acclamations of joy. All the streets were covered with bonfires. The bells were rung, and the air was rent with repeated shouts of gladness. All orders of men crowded to his coach; and, when he arrived at Whitehall, his apartments were crowded with people who came to express their joy at his return.

The prince of Orange received the news of his return with an haughty air. His aim from the beginning was to force him by threats and severities to relinquish the throne. The Dutch guards were ordered to take possession of Whitehall, and to displace the English. The king was soon after commanded by a message, which he received in bed at midnight, to leave his palace next morning, and to depart for Ham, a seat of the duchess of Lauderdale's. He desired,

N^o 56.

however, permission to retire to Rochester, a town not far from the sea-coast, and opposite to France. This was readily granted; and it was now perceived that the harsh measures of the prince had taken effect, and that the king meditated an escape to France.

The king, surrounded by the Dutch guards, arrived at Rochester on the 19th of December. The restraint put upon his person, and the manner in which he had been forced from London, raised the indignation of many, and the compassion of all. The English army, both officers and soldiers, began to murmur; and had it not been for the timidity and precipitation of James himself, the nation had certainly returned to their allegiance. He remained three nights at Rochester, in the midst of a few faithful friends. The earls of Arvan, Dumbarton, Ailesbury, Litchfield, and Middleton, werethere; and, with other officers of merit, the gallant lord Dundee. They argued against his flight with united efforts. Several bishops, some peers, and many officers, intreated his stay in some part of England. Message followed message from London. They represented that the opinions of men began to change, and that events would daily rise in favour of his authority. Dundee added his native ardour to his advice. "The question, Sir, (said he), is, Whether you shall stay in England, or fly to France? Whether you shall trust the returning zeal of your native subjects, or rely on a foreign power? Here you ought to stand. Keep possession of a part, and the whole will submit by degrees. Resume the spirit of a king. Summon your subjects to their allegiance. Your army, though disbanded, is not dispersed. Give me your commission. I will gather 10,000 of your troops. I will carry your standard at their head through England, and drive before you the Dutch and their prince." The king replied, "that he believed it might be done; but that it would raise a civil war, and he would not do so much mischief to a nation that would so soon come to their senses again." Middleton urged his stay, though in the remotest part of the kingdom. "Your majesty, (said he), may throw things into confusion by your departure; but it will be but the anarchy of a month: a new government will soon be settled, and you and your family will be ruined." These spirited remonstrances had no effect upon James. He resolved to quit the kingdom; and having communicated his design to a few of his friends, he passed at midnight through the back-door of the house where he lodged, and with his son the duke of Berwick, and Biddulph one of his servants, went in a boat to a smack, which lay waiting for him without the fort of Sheerness. By reason of a hard gale they were forced to bear up toward Leigh, and to anchor on the Essex-side, under the lee of the land. When the gale slackened, they reached the Buoy of the Narrows without tacking; but not being able to weather the Goodwin, they were forced to fail through the downs. Seven ships lay there at anchor; but the smack passed unquestioned along. Unable to fetch Calais, she bore away for Boulogne, and anchored before Ambleteuse. The king landed at three o'clock in the morning of Tuesday, December 25th; and tacking post, soon joined his queen at St Germans.

James having thus abandoned his dominions, the prince of Orange remained master of them of course. By the advice of the house of lords, the only member

Britain of the legislature remaining, he was desired to summon a parliament by circular letters; but the prince, unwilling to act upon so imperfect an authority, convened all the members who had sat in the house of commons during any parliament of Charles II. and to these were added the mayor, aldermen, and fifty of the common council of London; and the prince, being thus supported by an assembly deriving its authority from himself, wrote circular letters to the counties and corporations of England to call a new parliament.

301 The throne declared vacant. The house being met, which was mostly composed of the Whig party, thanks were given to the prince of Orange for the deliverance he had brought them; after which they proceeded to settle the kingdom. A vote soon passed both houses, that king James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between the king and his people, and having by the advice of Jesuits and other wicked persons violated the fundamental laws, and withdrawn himself out of the kingdom, had abdicated the government; and that the throne was thereby vacant.

302 William raised the sovereignty. The king being thus deposed, it was easy for William to get himself appointed as his successor. Proposals were made for electing a regent. Others were for investing the prince of Orange with regal power, and declaring the young prince supposititious. To these proposals, however, William opposed the following decisive argument, *viz.* that "he had been called over to defend the liberties of the British nation, and that he had happily effected his purpose; that he had heard of several schemes proposed for the establishing of the government; that, if they chose a regent, he thought it incumbent upon him to inform them that he would not be that regent; that he would not accept of the crown under the prince's his wife, though he was convinced of her merits; that therefore, if either of these schemes was adopted, he could give them no assistance in the settlement of the nation; but would return home to his own country, satisfied with his aims to secure the freedom of theirs." Upon this, after a long debate in both houses, a new sovereign was preferred to a regent by a majority of two voices. It was agreed that the prince and princess of Orange should reign jointly as king and queen of Britain; while the administration of government should be placed in the hands of the prince only. The marquis of Halifax, as speaker of the house of lords, made a solemn tender of the crown to their Highnesses, in the name of the peers and commons of Britain. The prince accepted the offer; and that very day, February 13th 1689, William and Mary were proclaimed king and queen of Great Britain.

Though Mary was comprehended in the royal title, she never possessed either the authority of a queen, or the influence of a wife. Her easy temper had long been subdued by the stern severity of a husband who had very few amiable qualities. Being brought up in a manner under the tuition of her spouse, and in some degree confined by his orders, she was accustomed to adopt implicitly his political maxims and even his thoughts; and in consequence of her want of importance with him, she ceased to be an object of consequence in the eyes of the nation.

William began his reign with issuing a proclamation

for continuing in office all protestants that had been in place on the first of the preceding December. On the 17th of the month he formed his privy council, which consisted chiefly of such persons as had been most active in raising him to the throne. To gratify as many as possible of his friends, the several boards, and even the chancery, were put into commission. The benches of the exchequer and common law were filled with persons who had distinguished themselves against the measures of the late king. The earl of Nottingham who had violently opposed the elevation of William, and the earl of Shrewsbury who had adhered to his views, were made secretaries of state. The marquis of Halifax, and the earl of Danby, though rivals in policy, were admitted into the cabinet; the first as lord privy seal, the second as president of the council. His Dutch friends in the mean time were not forgotten by the king. Bentinck, his favourite, was made a privy councillor, groom of the stole, and privy purse. Auverquerque was appointed master of the horse. Zuylicem received the office of master of the robes. Schomberg was placed at the head of the ordnance.

Though these instances of gratitude were no doubt necessary to William, the generality of the nation were displeas'd. The Tories were offended at being excluded from his favour, especially as they had departed from their principles in order to serve him. The nation in general were much prejudic'd against foreigners, and universal discontent ensued upon seeing them preferred. The king, who had been bred a Calvinist, was also very strongly inclin'd to favour that sect; and his prejudices in favour of Calvinism were almost equal to those of James in favour of Popery. Finding, therefore, the clergy of the church of England little inclin'd to take the oaths to the new government, he began openly to indulge his own prejudices in favour of dissenters. Having come to the house of lords to pass some bills, on the 16th of March, he made a speech, urging the necessity of admitting all Protestants indiscriminately into the public service. He told his parliament, that he had something to communicate, which would conduce as much to their settlement as to the disappointment of their enemies. He inform'd them, that he was employ'd in filling up the vacancies in offices of trust; and he hop'd that they were sensible of the necessity of a law to settle the oaths to be taken by such persons as should be admitted into place. As he doubted not, he said, that they would sufficiently provide a *substantial* Protestants, so he hop'd that they would leave room for the admission of all Protestants that were able and willing to serve.

This proposition was oppos'd with vehemence. The adherents of the church complain'd that the union which they fear'd from the Protestants in the preceding reign was now to be dread'd from the Protestant dissenters. They affirm'd, that if the established religion was to be destroyed, it matter'd little by whose hand it was fall. A bill brought in by the ministry for abolishing the former oaths of supremacy and allegiance was reject'd.

An attempt to dispose with the sacramental test was made without success in another form. The court party propos'd that any man should be sufficiently qualified to officiate by producing a certificate of his having received the sacrament in any Protestant congregation.

Britain

Britain

gation. But this motion was also rejected in the house of lords by a great majority. William repeated his attempts of a comprehension; but he was ultimately unsuccessful, and in the coronation-oath the church-party inserted a clause highly favourable to themselves, viz. that the king should maintain the Protestant religion "as established by law." To this clause William is said to have discovered an apparent unwillingness to swear.

305
Tottering condition of William's government

For these and other reasons the government of William was for some time but in a very tottering condition. The king, either through want of health or inclination, interfered but little in the affairs of the nation. Ireland was strangely neglected. Halifax and Danby, who had in a manner raised the king to the throne, caballed with his enemies. They perceived that the people, with the same levity that induced them to desert their former sovereign, were beginning to be discontented with their new prince. Every thing seemed to tend to a change. Halifax himself declared, that were James to conform with the Protestants, he could not be kept four months from reascending his throne. Darby averred, that, were the late king to give satisfaction for the security of religion, it would be difficult to oppose his restoration. From these apparent discontents of the nation, the friends and emissaries of James assumed more boldness. They tampered with the servants of the crown, and inflamed the army. The former they alarmed with the prospect of a sudden change; the latter they roused into indignation by the manifest preference given by William to his countrymen the Dutch.

306
He is acknowledged king in Scotland.

Though the kingdom of Scotland did not at first recognize the authority of William, yet the party of James never attained sufficient strength to be of any effectual service to him in that kingdom. Thirty Scots peers, and near 80 gentlemen, then in London, had waited in the beginning of January on the prince of Orange. Without any authority from the regency still subsisting in Edinburgh, they formed themselves into a kind of convention. The prince of Orange in a formal manner asked their advice. He withdrew, and they adjourned to the council-chamber at Whitehall. The duke of Hamilton being chosen president, explained the distracted state of Scotland. He represented, that disorders, anarchy, and confusion, prevailed; and he urged the necessity of placing the power somewhere till a convention of states should be called to form a lasting and solid settlement. When the heads of their address to the prince of Orange were settled, and ordered to be engrossed, the earl of Arran unexpectedly arose, and proposed to invite back the king. The meeting, however, adhered to the prince of Orange; and waited on him in a body, requesting him to take the administration into his hands. He thanked them for the trust they had reposed in him; and a convention was ordered to meet at Edinburgh on the 14th of March, and it was provided that no exception or limitation whatever should be made, except that the members should be Protestants.

A secession, however, was made from this convention, in favour of James. The archbishop of Glasgow, the earl of Balcarras, and the viscount Dundee, were authorized by an instrument signed by the late king, at that time in Ireland, to call a convention of

the states at Stirling. But this measure was disappointed, first by the wavering disposition of the marquis of Athol, and afterwards by the delay and folly of the party. At last, the viscount Dundee, being alarmed by an information of a design formed by the covenanters to assassinate him, left Edinburgh at the head of 50 horse. When he passed under the walls of the castle, the duke of Gordon, who held that place, and favoured the cause of James, called him to a conference. He scrambled up the precipice, and informed the duke of his designs in favour of the late king. He conjured him to hold out the castle, under a certainty of being relieved. The novelty of the sight collected multitudes of spectators. The convention were alarmed. The president ordered the doors to be locked, and the keys to be laid upon the table. The drums were beat to alarm in the town. A parcel of ill-armed retainers were gathered together in the street by the earl of Leven. Dundee in the mean time rode off with his party. But when they found themselves secure, the duke of Hamilton adjourned the convention, which relieved the adherents of James from dreadful apprehensions for their own safety. Fifty members retired from Edinburgh; and that circumstance procured an unanimity in all the succeeding resolutions of the convention. Soon after this it was determined in a committee, that James had *forfeited* his right to the crown, by which was meant that he had perpetually excluded himself and his whole race from the crown, which was thereby become vacant. This resolution was approved by the convention, and another was drawn up for raising William and Mary to the vacant throne; in consequence of which they were proclaimed at Edinburgh on the 11th of April 1689.

The castle of Edinburgh was still kept, in the name of James, by the duke of Gordon: but despairing of any relief, and pressed by a siege, he surrendered it on the 13th of June, upon honourable terms. The adherents of James, terrified with this unexpected misfortune, now turned their eyes to the viscount Dundee. That nobleman having been in vain urged by the convention to return, they had declared him a fugitive, an outlaw, and a rebel. General Mackay had been sent to Scotland by William with four regiments of foot, and one of dragoons; and Dundee being apprised of his design to surprise him, retired to the Grampian mountains with a few horse. He marched from thence to Gordon castle, where he was joined by the earl of Dunfermline with 50 gentlemen. He then passed through the county of Murray to Inverness. Macdonald of Keppoch lay with 700 men before that town; after having ravaged, in his way from his own country, the lands of the clan of Macintosh. Dundee, having promised to the magistrates of Inverness to repay, at the king's return, the money extorted from them by Macdonald, induced the latter to join him with all his men. He could not prevent them, however, from first returning home with their spoil. He accompanied them to Lochaber, and on the 8th of May arrived in Badenoch. From thence he wrote letters to the chiefs of all the clans, appointing them to meet at a general rendezvous in Lochaber, on the 18th of the same month. In the mean time, passing suddenly through Athol, he surprised the town of Perth. In hopes of gaining to his party the two troops of Scots dragoons

307
Attempts of Lord Dundee in favour of James.

who

Britain. who lay at Dundee, he marched suddenly to that place; but the fidelity of captain Balfour, who commanded them, disappointed his views. Having raised the land-tax as he passed, Dundee returned through Athol and Rannoch to hold the diet of rendezvous at Lochaber. Here he was reinforced by several Highland chieftains, so that his army amounted to 1500 men. He pursued Mackay for four days, who had advanced to Inverness, but afterwards retreated to Strathbogie, leaving the whole Highlands exposed to the enemy.

Soon after, however, Dundee found himself surrounded with many difficulties. The officers of the Scots dragoons, who held a secret correspondence with him, wrote him false intelligence, as an excuse for their own fears. They informed him that a party of Irish, who had endeavoured to land in Scotland, under the duke of Berwick, were driven back, and the duke himself taken prisoner; and that Mackay had been reinforced with a regiment of English horse, and another of foot. On this intelligence, Dundee retreated to Badenoch. The natives of the low country who served in his army quitted him without leave; and the Highlanders plundered the country wherever they came: at last he himself fell sick, while Mackay hovered on his rear. A slight skirmish happened, in which the Highlanders prevailed; but they lost their baggage during the action. Dundee at length arrived at Ruthven; but Mackay being reinforced with a body of 1200 men advanced against him, and other regiments had arrived at Perth and Dumblain. The Highlanders now deserted every night by hundreds; their gallant leader himself was forced to retire to Lochaber, where only 200 of his whole force remained with him; and, to complete his misfortunes, he received at the same time news of the surrender of the castle of Edinburgh.

On the 23d of June, letters arrived from king James, with a promise of immediate succours from Ireland; upon which Dundee ordered the neighbouring clans to assemble round his standard. But still he had scarce any thing but the mere bodies of his men with which he could prosecute the war. The Highlanders were armed only with their own proper weapons, and he had no more than 40 pounds of powder in his whole army. All difficulties, however, were surmounted by the active spirit of the general, for whom the army entertained an enthusiastic zeal. On the 17th of July, he met the king's forces under general Mackay, near the pass of Killieranky. An engagement ensued, in which the Highlanders were victorious. Two thousand of Mackay's men were lost either in the field or in the pursuit; but the victory cost the Highlanders very dear, for their brave general was mortally wounded. He survived the battle, however; and wrote an account of the victory to king James: he even imagined his wound was not mortal; but he died the next morning at Blair. With him ended all the hopes of James in Scotland. Colonel Cannon, who succeeded Dundee in the command, possessed neither his popularity nor his abilities. After some insignificant actions, in which the valour of the soldiers was more conspicuous than the conduct of their leader, the Highlanders dispersed themselves in disgust; and the war soon after ended favourably for William, without any repulse given to his enemies.

During the troubles in England, which had terminated in placing William on the throne, the two parties

in Ireland were kept in a kind of tranquillity by their mutual fears. The Protestants were terrified at the prospect of another massacre; and the Papists expected every day to be invaded by the joint force of the English and Dutch. Their terrors, however, were ill founded; for though Tyrconnel sent several messages to the prince, that he was ready to deliver up the kingdom to any force that might make a surrender decent, his offers were always rejected. William was persuaded by the marquis of Halifax, that, should Ireland yield, no pretence could remain for keeping an army in pay; that then, having no army to protect his authority, he might as easily be turned out as he had been brought in; that the English nation could never remain long in a state of good humour; and that he might perceive they already began to be discontented. These insidious arguments induced William to neglect Ireland in such a manner as is justly looked upon to be one of the greatest blemishes in his whole reign. His enemies, indeed, though perhaps without any good foundation, assign a worse cause: viz. that should England be considered under his government, Ireland could not long hold out; and that the obstinacy of his Irish enemies would give a pretence for forfeitures to gratify his English, but especially his foreign friends.

Tyrconnel, disappointed in his views of surrendering Ireland to the prince of Orange, affected to adhere to James. The whole military force of the kingdom at that time amounted only to 4000 men, and of these only 600 were in Dublin; and what was still worse, all of them were so much disposed to quit the service, that the lord deputy was obliged to issue commissions for levying new forces. Upon this, an half armed rabble, rather than army, rose suddenly in various parts of the kingdom. Having no pay from the king, they subsisted by depredation, and regarded no discipline. The Protestants in the north armed themselves in their own defence; and the city of Londonderry, relying on its situation, and a slight wall, shut its gates against the new-raised army. Protestant parties in the mean time rose every where, declaring their resolution to unite in self-defence, to preserve the Protestant religion, to continue their dependence on England, and to promote the meeting of a free parliament.

To preserve appearances, William now sent general Hamilton, an Irishman and a Roman catholic, to treat with Tyrconnel; but instead of persuading that lord to yield to William, this messenger advised him to adhere to James. In the mean time James himself assured the lord deputy, that he was ready to sail from Brett with a powerful armament. Hamilton, assuming spirit from the hopes of this aid, marched against the northern insurgents. They were routed with considerable slaughter at Drumore; and Hillsborough, where they had fixed their head-quarters, was taken without resistance: the city of Londonderry, however, resolved to hold out to the last extremity.

On the 7th of March 1689, James embarked at Brest. The whole force of his expedition consisted of 14 ships of war, 6 frigates, and 3 fire-ships. Twelve hundred of his native subjects in the pay of France, and 100 French officers, composed the whole army of James. He landed at Kinsale without opposition on the 12th of the month, where he was received with the most demonstrations of joy. His first care was to come in

the fort of Kinsale, the money, arms, and ammunition, which he brought from France; and put the town in some posture of defence: which having done, he advanced to Corke. Tyrconnel arrived at this place soon after, and brought intelligence of the rout at Drumore. The king was so much pleased with his attachment and services, that he created him a duke: after which, he himself advanced towards Dublin. The condition of the rabble, who poured round him under the name of an *army*, was not calculated to raise his hopes of success. The most of them were only provided with clubs; some had sticks tipped with iron; and even of those who were best armed, scarce two in a hundred had muskets fit for service. Their very numbers distressed their sovereignty, and ruined the country: insomuch that James resolved to disband the greatest part of them. More than 100,000 were already on foot in the different parts of the island. Of these he reserved 14 regiments of horse and dragoons, and 35 regiments of foot; the rest he ordered to their respective homes, and armed those that were retained in the best manner he could.

Being received at Dublin with an appearance of universal joy, James proceeded immediately to business. He ordered, by proclamation, all Protestants who had abandoned the kingdom to return. He commanded, in a second proclamation, all Papists, except those in his army, to lay up their arms, and put an end to the robberies and depredations which they had committed in the violence of their zeal. He raised the value of the currency by a proclamation; and he summoned a parliament to meet on the 7th of May, to settle the affairs of the kingdom. The Protestant clergy represented their grievances in an address; and the university of Dublin appeared with complaints and congratulations. He assured the first of his absolute protection, and a full redress; and he promised the latter not only to defend, but even to enlarge, their privileges.

On the 8th of April, James left Dublin, resolving to lead his army against the insurgents in person. They retired before him, and the king laid siege to Londonderry. The besieged made such a vigorous resistance as has made the place remarkable ever since: but being reduced to the last extremity, they would have been obliged to surrender, had not they been relieved on the 28th of July, by seven ships laden with provisions; upon which the siege was immediately raised.

In the mean time, the distressed situation of James, and his absolute dependence upon France, drove him into measures which otherwise he would never have thought of. His soldiers for some time had been supported by their officers, or subsisted by depredation. The funds of the officers were at last exhausted, and the country itself could no longer bear the riot and injustice of the soldiers. Pressed by these difficulties, James, by the advice of his council, resolved to coin pieces of copper, which should be received for silver. He saw well enough the inconveniences of this measure; but all Ireland possessed not the means of paying the army, in current coin, to the middle of June. Of the French remittances only 200,000 livres remained; and the king found it absolutely necessary to reserve that sum, to forward his measures with regard to Britain, and to procure intelligence of the motions of his enemies. The army was satisfied even with this ap-

pearance of money, and the people received the fictitious coin in hopes of being repaid in a more favourable state of affairs. A tax of 20,000*l.* a month, granted for 13 months by the parliament, furnished government with an appearance of resources; and in the mean time the king endeavoured to support the former revenue. He opened a trade with France to supply the want of commerce with England. But the French, knowing their own importance, and the necessity of the unfortunate monarch's affairs, claimed and obtained advantages in traffic which offended his own subjects.

To add to the distress of James, Ireland was now invaded by 10,000 men under the command of the duke of Schomberg. They appeared on the 12th of August 1689, in 90 transports, on the coast of Donaghadee, in the county of Down. Next day Schomberg landed without opposition his army, horses, and train of artillery. Having marched to Belfast on the 15th, he continued in that place four days to refresh his troops. He invested Carrickfergus, and threw into it 1000 bombs, which laid the houses in ashes. The garrison having expended their powder to the last barrel, marched out with all the honours of war. But Schomberg's soldiers broke the capitulation. They disarmed and stripped the inhabitants, without any regard to sex or quality; even women, stark naked, were publicly whipped between the lines; and all this under pretence of cruelties of the same kind having been committed by the Papists.

Though Schomberg was an experienced general, who had passed a life of 80 years almost continually in the field, he found himself at a loss how to carry on the war in Ireland. He did not consider the dangers that threatened the health of his troops by confining them too long in one place; and he kept them in a low moist camp near Dundalk, almost without firing of any kind; so that the men fell into fevers and fluxes, and died in great numbers. The enemy were not less afflicted with similar disorders. Both camps remained for some time in sight of each other; and at last, the rainy season approaching, both armies quitted their camps at the same time, and retired into winter quarters.

The bad success of the campaign, and the miserable situation of the Protestants in Ireland, at length induced William to attempt their relief in person. Accordingly he left London on the 4th of June 1690, and arrived at Carrickfergus on the 14th of that month. From thence he passed to Lisburn, the head quarters of the duke of Schomberg. He reviewed at Lough-Britland his army, which consisted of 36,000 men, and was composed of English, Dutch, Germans, Danes, and French. Being supplied with every necessary, and in high health and spirits, they seemed absolutely certain of victory. The Irish army, having abandoned Ardee at their approach, fell back to the south of the Boyne. On the banks of that river they were joined by James, who had marched from Dublin at the head of his French auxiliaries. The banks of the Boyne were steep; the south side hilly, and fortified with ditches. The river itself was deep, and it rose very high with the tide. These advantages induced James, contrary to the opinion of his officers, to keep possession of this post. His army was inferior in numbers, discipline, and every thing, to

³¹⁸ Battle at the Boyne.

his enemies: but slight, he thought, would dispirit his troops, and tarnish his own reputation; he therefore resolved to put the fate of Ireland on the issue of a battle. Urged by his friends in England, and encouraged by a projected invasion of that kingdom by France, he had resolved to quit Ireland; and to this he was farther encouraged by the assurance of aid from a powerful fleet that had already entered the narrow seas. But the strength of his situation, and the sudden appearance of the enemy, which made even a retreat dangerous, induced him to defer his purpose.

William was no sooner arrived, than he rode along the river's side, in sight of both armies, to make proper observations on the plan of battle; but in the mean time, being perceived by the enemy, a cannon was privately brought out and planted against him where he was sitting. The shot killed several of his followers, and he himself was wounded in the shoulder. The news of his being slain was instantly propagated thro' the Irish camp, and even sent off to Paris; but William, as soon as his wound was dressed, rode through the camp, and quickly undeceived his army.

The next day, (June 30th), the battle began at six in the morning. James's forces behaved with great resolution, but were at last defeated with the loss of 1500 men. The Protestants lost but about one third of that number; but among these was their brave general the duke of Schomberg. He was killed by a discharge from his own troops, who, not knowing that he had been accidentally hurried into the middle of the enemy, fired upon the body of men who surrounded him. During the action, James stood on the hill of Dunmore, surrounded with some squadrons of horse; and at intervals was heard to exclaim, when he saw his own troops repelling those of the enemy, "O spare my English subjects!" While his troops were yet fighting, he quitted his station; and leaving orders to guard the pass at Duleck, made the best of his way to Dublin. He advised the magistrates of that city to make the best terms they could with the victors; and he himself set out for Waterford, where he immediately embarked for France. When he first deserted his troops at the Boyne, O'Regan, an old Irish captain, was heard to say, "That if the English would exchange generals, the conquered army would fight them over again."

The victory at the Boyne was by no means decisive, and the friends of James resolved to continue their opposition to William. Sarsfield, a popular and experienced general, put himself at the head of the army that had been routed at the Boyne, and went farther into the country to defend the banks of the river Shannon. James appointed one St Ruth to command over Sarsfield, which gave the Irish universal discontent. On the other hand, general Ginckle, who had been appointed to command the English army in the absence of William, who was gone over to England, advanced towards the Shannon to meet the enemy. The only place where it was fordable was at Athlone, a strong walled town built on both sides of the river, and in the hands of king James's party. The English soon made themselves masters of that part which was on the hither side of the river; but the part on the opposite bank being defended with great vigour, was for a long while thought impregnable. At length it was resolved in a council of war, that a body of forlorn hope should ford

the stream in the face of the enemy; and this desperate enterprize was performed with great resolution: the enemy were driven from their works, and the town surrendered at discretion. St Ruth marched his army to its relief, but he came too late; for he had not approached, than his own guns were turned against him: upon which he instantly marched off, and took post at Aughlim, at ten miles distance, where he determined to wait the English army. Ginckle did not decline the combat, though he had only 18,000 men, while the Irish were above 25,000 strong. A desperate engagement ensued; but at last St Ruth being killed, his troops gave way on all sides, and retreated to Limerick, where they determined to make a final stand, after having lost near 5000 of their best men.

Ginckle, willing to put an end to the war at once, suffered as many of the Irish as chose to retire to Limerick. In this last retreat the Irish forces made a brave defence. The siege commenced August 25th 1691. Six weeks were spent before the place without any decisive effect. The garrison was well supplied with provisions, and provided with all means of defence. The winter was approaching, and Ginckle had orders to finish the war upon any terms. He therefore offered such conditions as the Irish, had they been victors, could scarce have refused with prudence. He agreed, that all in arms should receive their pardon: that their estates should be restored, their attainders annulled, and their outlawries reversed: that none should be liable for debts incurred through deeds done in the course of hostilities: that all Roman catholics should enjoy the same toleration with regard to their religion, as in the reign of Charles II.: that the gentry should be permitted to make use of arms: that the inferior sort should be allowed to exercise their callings and professions: that no oaths but that of allegiance should be required of high or low: that should the troops, or any number of them, chuse to retire into any foreign service, they should be conveyed to the continent, at the expence of the king. Sarsfield, who had obtained the title of *earl of Lucan* from James after his abdication, was permitted to retain a dignity which the laws could not recognize. The lords justices had arrived from Dublin on the first of October. They signed the articles together with Ginckle; and thus the Irish Papists put a happy period to a war which threatened their party with absolute ruin. In consequence of this treaty, about 14,000 of those who had fought for king James went over to France, having transports provided by government for conveying them thither. When they arrived, James thanked them for their loyalty, and told them that they should still fight for their old master; and that he had obtained an order from the king of France, for their being new clothed, and put into quarters of refreshment. In this manner all James's expectations from Ireland were entirely frustrated, and the kingdom submitted quietly to the English government.

In the beginning of the year 1692, an action of unexampled barbarity disgraced the government of William in Scotland. In the preceding August, in consequence of a pacification with the Highlanders, a proclamation of indemnity had been issued to such insurgents as should take the oaths to the king and queen, on or before the last day of December. The chiefs of the few tribes who had been in arms for James complied soon after with the proclamation: but Macdonald of

Glenco failed in submitting within the limited time; more, however, from accident than design. In the end of December, he came to colonel Hill, who commanded the garrison in fort William, to take the oaths of allegiance to the government. Hill, having furnished Macdonald with a letter to Sir Colin Campbell, sheriff of the county of Argyle, directed him to repair immediately to Inverary, to make his submission in a legal manner before that magistrate. The way to Inverary lay through almost impassable mountains; the season was extremely rigorous, and the whole country covered with a deep snow. So eager, however, was Macdonald to take the oaths, before the limited time should expire, that, tho' the road lay within half a mile of his own house, he would not stop to visit his family. After various obstructions, he arrived at Inverary. The time was elapsed, and the sheriff hesitated to receive his submission; but Macdonald prevailed on him by his importunities, and even tears. Sir John Dalrymple, afterwards earl of Stair, attended king William as secretary of state for Scotland. He took advantage of Macdonald's neglecting to take the oaths within the time prescribed, and procured from the king a warrant of military execution against him and his whole tribe. As a mark of his own eagerness, or to save Dalrymple, William signed the warrant, both above and below, with his own hand. The secretary, in letters expressive of a brutal ferocity of mind, urged the officers who commanded in the Highlands to execute their orders with the utmost rigour. Campbell of Glenlyon, a captain in Argyle's regiment, and two subalterns, were ordered, with 120 men, to repair to Glenco on the first of February. Campbell, being uncle to young Macdonald's wife, was received by the father with all manner of friendship and hospitality. The men were treated in the houses of his tenants with free quarters and kind entertainment. Till the 13th of the month, the troops lived in good humour and familiarity with the people. The officers, on the very night of the massacre, passed the evening and played at cards in Macdonald's house. In the night, lieutenant Lindsay, with a party of soldiers, called in a friendly manner at his door. He was instantly admitted. Macdonald, as he was rising to receive his guest, was shot dead behind his back, with two bullets. His wife had already put on her clothes; but she was stripped naked by the soldiers, who tore the rings off her fingers with their teeth. The slaughter was become general. To prevent the pity of the soldiers to their hosts, their quarters had been changed the night before. Neither age nor infirmity was spared. Some women, in defending their children, were killed. Boys, imploring mercy, were shot by officers, on whose knees they hung. In one place, nine persons, as they sat enjoying themselves at table, were shot dead by the soldiers. At Inverjigen, in Campbell's own quarters, nine men were first bound by the soldiers, and then shot at intervals, one by one. Near 40 persons were massacred by the troops. Several, who fled to the mountains, perished by famine and the inclemency of the season. Those who escaped owed their lives to a tempestuous night. Lieutenant colonel Hamilton, who had the charge of the execution from Dalrymple, was on his march with 400 men, to guard all the passes from the valley of Glenco; but was obliged to stop by the severity of the weather, which proved the safety

of the unfortunate tribe. He entered the valley next day; laid all the houses in ashes; and carried away all the cattle and spoil, which were divided among the officers and soldiers.

It can scarce be imagined that a massacre attended with such circumstances of treachery and breach of the laws of hospitality, could pass without some animadversion; though the expressions of Cunningham, a writer very partial to the character of king William, seem to account it a fault that it should ever have been inquired into. "Mr James Johnstone, one of the secretaries of state (says he), from motives of revenge, caused the affair of Glenco to be laid before parliament. This being somewhat disingenuously managed, was the occasion of much trouble to many people. The earl of Breadalbin was committed to the castle of Edinburgh: but the lord viscount Stair, who lay under some suspicion on that account, in a very artful speech endeavoured to resolve the whole matter into a misapprehension of dates; which, he alleged, had led both the actor in the slaughter complained of, and those who now accused him, into mistakes. In conclusion he affirmed, that neither the king nor any other person was to be blamed, save only the misled captain, who did not rightly understand the orders that had been given him." The most disgraceful circumstances of the massacre are by the same author concealed; as he only tells us, that "it unhappily fell out, that the whole clan of Glenco, being somewhat too late in making their submission to king William, were put to the sword by the hands and orders of captain Campbell; which gave great offence to the king. It is certain the king had cause of resentment against some of his courtiers on account of this foul action; but he thought fit not to question them for it till he could settle himself more firmly on the throne."

It is not improbable, that partly to efface the remembrance of this massacre, and the sham inquiry above mentioned, the king now caused his commissioner to declare in the Scots parliament (the same that had inquired into the affair of Glenco), "That if the members found it would tend to the advancement of trade that an act should be passed for the encouragement of such as should acquire and establish a plantation in Africa, America, or any other part of the world where plantations might be lawfully acquired, that his majesty was willing to declare he would grant to the subjects of this kingdom, in favour of these plantations, such rights and privileges as he granted, in like cases, to the subjects of his other dominions." Relying on this and other flattering promises, the nobility and gentry of Scotland advanced L. 400,000 towards the establishment of a company for carrying on an East and West India trade; and 1200 veterans who had served in king William's wars were sent to effect a settlement on the peninsula of Darien, which lies between the Atlantic and Pacific oceans, and in the narrowest place is not above 60 miles over; and of consequence is equally well adapted for trading with both the Indies.

The new colony were well received by the natives, and matters began to wear a promising aspect, when the king, on the earnest solicitations of the English and Dutch East India Companies, resolved to gratify the latter at the expence of his Scottish subjects; and knowing that

the new colony must want supplies of provisions, he sent orders to the governor of Jamaica and the English settlements in America to issue proclamations, prohibiting, under the severest penalties, all his majesty's subjects from holding any correspondence with the Scottish colony, or assisting it in any shape with arms, ammunition, or provisions: "Thus (says Mr Knox) the king's heart was hardened against these new settlers, whom he abandoned to their fate, though many of them had been covered with wounds in fighting his battles.

"Thus vanished all the hopes of the Scottish nation, which had engaged in this design with incredible alacrity, and with the most sanguine expectations that the misfortunes of their country would, by this new channel of commerce, be completely healed.

"The distresses of the people, upon receiving authentic accounts of the fortune of their colony, scarcely admit of any description. They were not only disappointed in their expectations of wealth and a renewal of their commerce; but hundreds, who had ventured their all, were absolutely ruined by the miscarriage of the design.

"The whole nation seemed to join in the clamour that was raised against their sovereign. They taxed him with double dealing, inhumanity, and base ingratitude, to a people who had lavished their treasure and best blood in support of his government, and in the gratification of his ambition; and had their power been equal to their acrimony, in all probability the island would have been involved in a civil war."

Such is the account of this transaction given by Mr Knox; on the other hand, Mr Cunningham tells us, that "the same parliament (which had inquired into the Glencoe affair) also had under their consideration a scheme for settling a trade and planting a colony in America, which proved afterwards an occasion of manifold evils, and was matter of great complaint both to the English and the Spaniards. The Scots, carrying on the settlement of the colony which has been just mentioned with extravagant parade, and noise, and subscriptions, filled not only England, but all other countries also, with apprehensions lest Scotland should, in process of time, become the emporium of all the trade of Europe. But they never considered how few would trust their fortunes to the disposal of such a numerous nobility, nor calculated the frauds of their own managers; by which means the whole affair was afterwards ruined. Discords arising on this head between the two kingdoms, old hostilities were recalled to mind; the cattle were driven off from the borders; the customs were defrauded, and other injuries committed; and at last the Spaniards complained of the Scots. Therefore, to prevent the mischiefs which might arise to both kingdoms, the king had nothing so much at heart as to bring about an union upon as fair terms as he could," &c.

The total reduction of Ireland, and the dispersion and extermination of the Highland chieftains who favoured his cause, did not entirely put an end to the hopes of James. His chief expectations next were founded on a conspiracy among his English adherents, and in the succours promised him by the French king. A plot was first formed in Scotland by Sir James Montgomery; a person who, from being an adherent to

William, now turned against him: but as the project was ill contrived, so it was as lightly discovered by the instigator. To this another succeeded, which seemed to threaten more serious consequences, as it was managed by the whig party, who were the most formidable in the state. A number of these joined themselves to the Tories, and both made advances to the adherents of the late king. They assembled together; and the result of their deliberations was, that the restoration of James was to be effected entirely by foreign forces: that he should sail for Scotland, and be there joined by 5000 Swedes; who, because they were of the Protestant religion, would, it was thought, remove a part of the odium which attended an invasion by foreigners: it was concerted that assistance should at the same time be sent from France, and that full liberty of conscience should be proclaimed throughout the kingdom. In order to this end, it was resolved to send over to France two truly persons to consult with the banished monarch; and lord Preston and Mr Ashton were the two persons appointed for this embassy. Both of them, however, were seized when they least expected it, by order of lord Caermarthen. Both were condemned, and Ashton was executed without making any confession; but lord Preston had not the same resolution. Upon an offer of pardon, he discovered a great number of associates; among whom the duke of Ormond, lord Dartmouth, and lord Clarendon, were foremost.

The French at last became sensible of their bad policy in not having better supported the cause of James, and therefore resolved to make a descent upon England in his favour. In pursuance of this scheme, the French king supplied James with an army consisting of a body of French troops, some English and Scots refugees, and the Irish regiments, which had been transported into France from Limerick, and were now become excellent soldiers by long discipline and severe duty. This army was assembled between Charbourg and La Hogue, and commanded by king James in person. More than 300 transports were provided for landing it on the opposite coast; and Tourville, the French admiral, at the head of 63 ships of the line, was appointed to favour the descent. His orders were, at all events, to attack the enemy, in case they should oppose him; so that every thing promised the banished king a change of fortune.

These preparations on the side of France were soon known at the English court, and every precaution taken for a vigorous opposition. All the secret machinations of the banished king's adherents were discovered to the English ministry by spies; and by these they found that the Tories were more faithful than even the Whigs who had placed king William on the throne. The duke of Marlborough, lord Godolphin, and even the princess Anne herself, were violently suspected of disaffection. Preparations, however, were made, with great tranquillity and resolution, to resist the growing storm. Admiral Russel was ordered to put to sea with all possible expedition; and he soon appeared with 99 ships of the line, besides frigates and fire-ships. At the head of this formidable fleet he set sail for the coast of France; and, near La Hogue, he discovered the enemy under Tourville, who prepared to give him battle. The engagement began between the two admirals with

Britain.

330
Who are
defeated.

great fury, and the rest of the fleet soon followed their example. The battle lasted for ten hours; but at last victory declared on the side of numbers: the French fled for Conquet road, having lost four ships in the first day's action. The pursuit continued for two days following: three French ships of the line were destroyed the next day; and 18 more, which had taken refuge in the bay of La Hogue, were burnt by Sir George Rooke. In this manner were all the French preparations frustrated; and so decisive was the blow, that from this time France seemed to relinquish all claims to the ocean.

331
James of-
fended the
crown of
Poland;332
Which he
refuses.

This engagement, which happened on the 21st of May 1692, put a final period to the hopes of James. No further attempts were made in his favour, except some plots to assassinate king William, which ended only in the destruction of those who formed them. But it was never thoroughly proved that James countenanced these plots in the least; it rather appears, that in all cases he expressed the utmost abhorrence of such attempts. In 1697, the abbe de Polignac, ambassador from France in Poland, wrote to his master, that thoughts were entertained of the late king of Britain, in the new election which happened on the death of John Sobieski king of Poland; and that James had been already named by some of the diets as his successor. Louis was eager to seize an opportunity of ridding himself with honour of a prince whose pretensions he could no longer support. The friends of James were also sanguine for the project; but he himself refused it. He told them, that "he would ever retain a grateful remembrance of his friends in Poland. That, however, he would not accept of the crown, had it actually been offered; much less would he endeavour to obtain by solicitation any crown which was not actually his due. That his acceptance of any other sceptre would amount to an abdication indeed of that which he deemed his right. That therefore he was resolved to remain in his present forlorn condition, possessing less hopes than ever of being restored, rather than to do the least act of prejudice to his family." The same year, at an interview between king William and Louis XIV. it was proposed that the prince of Wales (James's son) should succeed to the throne of England after the death of William. The king with little hesitation agreed to this request. He even solemnly engaged to procure the repeal of the act of settlement; and to declare, by another, the prince of Wales his successor to the throne. Even this proposal was rejected by James. He told the king of France, that though he could suffer with patience the usurpation of his nephew upon his right, he would never permit his own son to be guilty of the same injustice. He urged, that should the son reign in his father's lifetime, that circumstance would amount to a formal renunciation. That the prince of Wales, by succeeding to the prince of Orange, would yield his sole right, which was that of his father, &c.

333
William en-
gaged to

James re-
fuses.335
His death.

From this time James lost every hope of being restored to the throne, and resigned himself entirely to the austerities of religious enthusiasm. His constitution, though vigorous and athletic, had for some time begun to yield to the infirmities of age, and to that melancholy which superstition as well as his uncommon misfortunes had impressed on his mind. In the beginning

of September 1701, when he was, according to his daily custom, at public prayers, he fell suddenly into a lethargy; and though he recovered his senses soon after, he languished for some days, and expired on the 6th of September. The French king, with great humanity, paid him several visits during his sickness; and exhibited every symptom of compassion, affection, and even respect.

Louis, being under a difficulty how to proceed upon the unexpected death of James, called a council to take their advice, whether he should own the prince of Wales as king of Great Britain and Ireland. The king himself had hesitated long in this delicate point. But the dauphin, the duke of Burgundy, and all the princes of the blood, declared, that it was unbecoming the dignity of the crown of France not to own that the titles of the father devolved immediately upon the son. Louis approved of this resolution, and determined to acquaint the dying king with it in person. When he arrived at St Germain, he acquainted first the queen, and then her son, of his design. He then approached the bed in which James lay almost insensible with his disorder. The king, rousing himself, began to thank his most Christian majesty for all his favours; but Louis interrupted him. "Sir (said he), what I have done is but a small matter; but what I have to say is of the utmost importance." The people then began to retire. "Let no person withdraw (said Louis). I come to acquaint you, Sir, that when God shall please to call your majesty from this world, I shall take your family into my protection, and acknowledge your son, as he then will certainly be, king of Great Britain and Ireland."

337
Preten-
sions
Louis
the king
of Britain

Though the defeat of the French fleet at La Hogue had put king William out of all danger from any further attempts from that quarter, he by no means possessed his throne with any kind of tranquillity. The want of a common enemy produced dissensions among the people, and William began to find as much uneasiness from his parliament at home as from an enemy in the field. The uneasiness he felt from the refractory disposition of his subjects was not a little heightened by the death of his queen, who was taken off by the small-pox on the 28th of December 1694. For some time he was under a sincere concern for her loss; but as politics had taken entire possession of his mind, he lost all other concerns in the greatness of his apprehensions for the balance of power and the fluctuating interests of Europe.

338
Death
queen

His chief motive for accepting the crown was to engage England more deeply in the concerns of Europe. His great object had been to humble the French, and all his politics consisted in forming alliances against them. On the other hand, many of the English had no such animosity against the French; and these, therefore, considered the interest of the nation as sacrificed to foreign connections; and complained that the continental war fell most heavily on them, though they had the least interest in its success. These complaints were heard by William with the most phlegmatic indifference; he employed all his attention only on the balance of power, and the interests of Europe. He became unmindful of the cultivation of internal polity; and, as he formed alliances abroad, increased the influence of party at home. Patriotism began to be ridiculed

339
Nation
discouraged

disculed as an ideal virtue; and the practice of bribing a majority in parliament became universal. The example of the great was caught up by the vulgar; principle, and even decency, was gradually banished; talents lay uncultivated, and the ignorant and profligate were received into favour.

The king, upon accepting the crown, was resolved to preserve as much of the prerogative as possible; and he sometimes exerted a branch of it which his predecessors had never chosen to make use of, viz. the power of refusing his assent to some bills that had passed both houses. From this and other causes there were perpetual bickerings between him and his parliaments. At last William became fatigued with opposition. He admitted every restraint upon the prerogative in England, upon condition of being properly supplied with the means of humbling France. Provided the parliament supplied him with the means of executing this, he permitted them to rule the internal polity as they pleased. For the prosecution of the French war, the sums granted were indeed incredible. The nation, not contented with furnishing him such sums of money as they were capable of raising by the taxes of the year, mortgaged those taxes, and involved themselves in debts which they have never since been able to discharge.

The war with France continued during the greatest part of this king's reign; but at length the treaty of Ryswick, in 1697, put an end to those contentions in which England had engaged without policy, and came off at last without advantage. In the general pacification, her interests seemed entirely deserted; and for all the treasures she had sent to the continent, and all the blood which had been shed there, the only equivalent received was an acknowledgment of William's title from the king of France.

The king, being now freed from a foreign war, set himself to strengthen his authority at home. As he could not bear the thoughts of being a king without military command, he conceived hopes of keeping up, in the time of a profound peace, those forces which had been granted during the time of danger. The commons, however, to his great mortification, passed a vote, that all the forces in the English pay, exceeding 7000 men, should be forthwith disbanded; and that those retained should be natural-born subjects of England. With this vote the king was exceedingly displeas'd. His indignation, indeed, was kindled to such a degree, that he actually conceived a design of abandoning the government. From this, however, his ministers diverted him, and persuaded him to consent to the passing of the bill.

These altercations continued during the remainder of this reign. William considered the commons as a body of men desirous of power for themselves, and consequently bent upon obstructing all his projects to secure the liberties of Europe. He seemed but little attached to any particular party in the house, all of whom he found at times deserted or opposed him. He therefore veered to whigs and Tories indiscriminately, as interest or the immediate exigence demanded. He considered England as a place of labour, anxiety, and altercation. If he had any time for amusement or relaxation, he retired to Loo in Holland, where, among a few friends, he gave a loose to those coarse festivities which he alone was capable of relishing. Here he plan-

ned the different succession of the princes of Europe, and laboured to undermine the schemes and the power of Louis his rival in politics and fame.

But however feeble William's desire of other amusements might be, he could scarce live without being at variance with France. Peace had scarce been made with that nation, when he began to think of resources for carrying on a new war, and for inviting his English subjects in the confederacy against that nation. Several arts were used for inducing the people to second his aims; and the whole nation seemed at last to join in desiring a French war. He had been in Holland concerting with his allies operations for a new campaign. He had engaged in a negotiation with the prince of Hesse: who assured him, that if he would besiege and take Cadiz, the admiral of Castile and several other grandees of Spain would declare for the house of Austria. The elector of Hanover had resolved to concur in the same measures; the king of the Romans, and prince Lewis of Baden, undertook to invest Landau, while the emperor promised to send a powerful reinforcement into Italy: but death put a period to his projects and his ambition.

William was naturally of a very feeble constitution; and it was by this time almost quite exhausted by a series of continual disquietude and action. He had endeavoured to repair his constitution, or at least to conceal its decays, by exercise and riding. On the 21st of February 1702, in riding to Hampton-court from Kensington, his horse fell under him; and he was thrown with such violence, that his collar-bone was fractured. His attendants conveyed him to the palace at Hampton-court, where the fracture was reduced; and in the evening he returned to Kensington in his coach. The jolting of the carriage disunited the fracture; and the bones were again replaced by Bidloo his physician. This, in a robust constitution, would have been a trifling misfortune; but to him it was fatal. For some time he appeared in a fair way of recovery; but falling asleep on his couch, he was seized with a shivering, which terminated in a fever and diarrhoea, that soon became dangerous and desperate. Perceiving his end approaching, the objects of his former care lay next his head; and the fate of Europe seemed to remove the sensations he might be supposed to feel for his own. The earl of Albemarle arriving from Holland, he conferred with him in private on the posture of affairs abroad. Two days after, having received the sacrament from archbishop Tennison, he expired, on Sunday March 8th; having lived 52 years, and reigned 13. He was in his person of a middle stature, a thin body, and a delicate constitution. He had an aquiline nose, sparkling eyes, a large forehead, and a grave solemn aspect. He left behind him the character of a great politician, though he had never been popular; and of a formidable general, tho' he had been seldom victorious. His deportment was grave, phlegmatic, and sullen; nor did he ever show any fire but in the day of battle.

Cunningham says, that "at the very last moment, when his mind was otherwise oppressed, he retained a just sense of the redemption of mankind, and the remembrance of his poor subjects. Thus he lay so quietly and composed, with his eyes fixed upon heaven, when his speech failed him, that no man could die either better prepared or with greater constancy and

piety, than this prince; of whose just praises no tongue shall be silent, and no time unmindful. And if any ambitious of regulating his councils and actions by the bright examples of the most famous great men, he may form to himself the idea of a great prince and a grand empire, not only from the king's life, but from the public records of the English and Dutch nations."

342
Accession
of queen
Anne.

William was succeeded by the princess Anne, who had married George prince of Denmark. She ascended the throne in the 38th year of her age, to the general satisfaction of all parties. William had died at the eve of a war with France: and the present queen, who generally took the advice of her ministry on every important occasion, was now urged by opposite councils; a part of her ministry being inclined to war, and another to peace. At the head of those who opposed a war with France was the earl of Rochester, lord lieutenant of Ireland, first cousin to the queen, and the chief of the tory faction. At the head of the opposite party was the earl afterwards duke of Marlborough, and since so much renowned for his victories over the French. After giving the reasons for both their opinions, that of Marlborough preponderated: the queen resolved to declare war; and communicating her intentions to the house of commons, by whom it was approved, war was proclaimed accordingly. In this declaration of war, Louis was taxed with having taken possession of a great part of the Spanish dominions; with designing to invade the liberties of Europe, to obstruct the freedom of navigation and commerce; and with having offered an unpardonable insult to the queen and her throne, by acknowledging the title of the pretender; he was accused of attempting to unite the crown of Spain to his own dominions, by placing his grandson upon the throne of that kingdom, and thus of endeavouring to destroy the equality of power that subsisted among the states of Europe. This declaration of war on the part of England was seconded by similar declarations by the Dutch and Germans, all on the same day.

343
War declared
against
France.

Louis XIV. whose power had been greatly circumscribed by William, expected, on the death of the latter, to enter on a field open for new conquests and fame. At the news of the English monarch's death, therefore, he could not suppress his rapture; the people of Paris, and indeed through the whole kingdom, testified their joy in the most public manner. At seeing, therefore, such a combination against him, the French monarch was filled with indignation; but his resentment fell chiefly on the Dutch. He declared with great emotion, that as for those gentlemen pedlars the Dutch, they should one day repent their insolence and presumption in declaring war against him whose power they had formerly felt and dreaded. By these threats, however, the affairs of the allies were no way influenced. Marlborough was appointed general of the British forces, and by the Dutch he was chosen generalissimo of the allied army; and indeed his after conduct showed, that no person could possibly have been chosen with greater propriety. He had learned the first rudiments of war under the famous marshal Turenne, having been a volunteer in his army; and by that general his future greatness was prognosticated.

344
Duke of
Marlborough appointed
general.

The first attempt that Marlborough made to deviate from the general practices of the army was to advance the subaltern officers, whose merits had been hitherto neglected. Regardless of seniority, wherever he found abilities, he was sure to promote them; and thus he had all the upper ranks of commanders rather remarkable for their skill and talents than for their age and experience. In his first campaign, in the beginning of July 1702, he repaired to the camp at Nimeguen, where he found himself at the head of 60,000 men well provided with all necessaries, and long disciplined by the best officers of the age. He was opposed on the part of France by the duke of Burgundy, a youth of very little experience in the art of war; but the real acting general was the marshal Boufflers, an officer of courage and activity. But wherever Marlborough advanced, the French were obliged to retire before him, leaving all Spanish Guelderland at his discretion. The duke of Burgundy finding himself obliged to retreat before the allied army, rather than expose himself longer to such a mortifying indignity, returned to Versailles, leaving Boufflers to command alone. Boufflers retired to Brabant: and Marlborough ended the campaign by taking the city of Liege; in which was found an immense sum of money, and a vast number of prisoners.

Britain.

345
His success
in his first
campaign.

This good fortune seemed to console the nation for some unsuccessful expeditions at sea. Sir John Munden had permitted a French squadron of 14 ships to escape him by taking shelter in the harbour of Corunna; for which he was dismissed the service by prince George. An attempt was made upon Cadiz by sea and land, Sir George Rooke commanding the navy, and the duke of Ormond the land forces; but this also miscarried. At Vigo, however, the British arms were attended with better success. The duke of Ormond landed with 2500 men at the distance of six miles from the city, while the fleet forcing their way into the harbour, the French fleet that had taken refuge there were burned by the enemy to prevent their falling into the hands of the English. Eight ships were thus burned and run ashore; but ten ships of war were taken, together with eleven galleons, and above a million of money in silver. In the West Indies, admiral Bembow had been stationed with ten ships to distress the enemy's trade. Being informed that Du Casse the French admiral was in those seas with a force equal to his own, he resolved to attack him; and soon after discovered the enemy's squadron near St Martha, steering along the shore. He quickly gave orders to his captains, formed the line of battle, and the engagement began. He found, however, that the rest of the fleet had taken some disgust at his conduct; and they permitted him to sustain, almost alone, the whole fire of the enemy. Nevertheless, the engagement continued till night, and he determined to renew it next morning. But he had the mortification to perceive that all the rest of his ships had fallen back, except one, who joined him in urging the pursuit of the enemy. Four days this intrepid seaman, assisted by only one ship, pursued and engaged the enemy, while his cowardly officers remained at a distance behind. His last day's battle was more furious than any of the former: alone, and unsupported by any of the rest, he engaged the whole French squadron; when his leg was shattered by a cannon-ball, and he himself died soon

Britain.

after of his wounds. Two of his cowardly associates were shot on their arrival in England; one died on his passage thither; the rest were disgraced.

The next parliament, which was convened by the queen, were highly pleased with the success of the British arms on the continent. The house of commons was composed chiefly of Tories, who voted 40,000 seamen, and the like number of land-forces, to act in conjunction with those of the allies. Soon after, the queen informed her parliament, that she was pressed by the allies to augment her forces; and upon this it was resolved that 10,000 more men should be added to the continental army, but on condition that the Dutch should immediately break off all commerce with France and Spain; a condition which was very readily complied with.

348
continent
my in-
cafes.

In the beginning of April 1703, the duke of Marlborough crossed the sea, and, assembling the allied army, opened the campaign with the siege of Bonn, the residence of the elector of Cologne. This held out but a short time. He next retook Huy; the garrison of which, after a vigorous defence, surrendered prisoners of war. Limburgh was next besieged, and surrendered in two days; and thus the campaign concluded, the allies having secured the country of Liege and the electorate of Cologne from the designs of the enemy.

349
success of
Marlboro-
ugh.

In the campaign of 1704, the Duke of Marlborough informed the Dutch that it was his intention to march to the relief of the empire, which had been for some time oppressed by the French forces; and the states gave him full powers to march as he thought proper, with assurances of their assistance in all his endeavours. The French king, finding Boufflers no longer capable of opposing Marlborough, appointed the marshal de Villeroy to command in his place. But Marlborough, who, like Hannibal of old, was remarkable for studying the disposition of his antagonists, having no great fears from Villeroy, immediately flew to the assistance of the emperor. Taking with him about 13,000 British troops, he advanced by hasty marches to the banks of the Danube; he defeated a body of French and Bavarians stationed at Donavert to oppose him; then passed the river, and laid under contribution the dukedom of Bavaria which had sided with the enemy. Villeroy, who at first attempted to follow his motions, seemed all at once to have lost sight of the enemy; nor was he apprised of his route, till informed of his successes. But, in the mean time, marshal Tallard prepared by another route to obstruct Marlborough's retreat, with an army of 30,000 men. He was soon after joined by the duke of Bavaria's forces; so that the French army in that part of the continent amounted to 60,000 veterans, commanded by the two best reputed generals then in France.

350
French de-
feated at
Blenheim.

To oppose these powerful generals, the duke of Marlborough was joined by a body of 30,000 men under the celebrated prince Eugene. The allied army, with this reinforcement, amounted to about 52,000. After various marches and countermarches, the two armies met at Blenheim. A terrible engagement ensued, in which the French were entirely defeated, and a country of 100 leagues extent fell into the hands of the conquerors. Soon after finishing the campaign, the duke repaired to Berlin, where he procured a reinforcement of 8000 Prussians to serve under prince Eugene in Italy.

* See Blenheim.

Thence he proceeded to negotiate for succours at the court of Hanover; and soon after returned to England; where he was received with every possible demonstration of joy.

Britain.

The arms of Britain, in the mean time, were not less fortunate by sea than by land. The town of Gibraltar was taken by the prince of Hesse and Sir George Rooke; but so little was the value of the conquest at that time understood, that it was for some time in debate whether it was a capture worth thanking the admiral for; and at last it was considered as unworthy of public gratitude. Soon after, the British fleet, to the number of 53 ships of the line, came up with that of France, consisting of 52 men of war, commanded by the count de Thoulouse, off the coast of Malaga. This was the last great naval engagement in which the French ventured to face the British on equal terms. The battle began at ten in the forenoon, and continued with great fury for six hours; when the van of the French began to give way. The British admiral, for two days, attempted to renew the engagement; but this was as cautiously declined by the French, who at last disappeared totally. Both sides claimed the victory, but the consequences decided it in favour of the British.

351
Gibraltar
taken.

352
French de-
feated at
sea.

In the mean time, the Spaniards, alarmed at the taking of Gibraltar, sent the marquis of Villadurias with a large army to retake it. France also sent a fleet of 13 ships of the line: but part of them were dispersed by a tempest, and part taken by the British. Nor was the land army more successful. The siege continued for four months; during which time the prince of Hesse, who commanded the town for the English, gave many proofs of valour. At length, the Spaniards having attempted to scale the rock in vain, finding no hopes of taking the place, were contented to draw off their men and abandon the enterprise.

353
intended
attempt of
the Spaniards on
Gibraltar.

While the British were thus victorious by land and sea, a new scene of contention was opened on the side of Spain. Philip IV. grandson of Louis XIV. had been placed on the throne of that kingdom, and received with the joyful concurrence of the greatest part of his subjects. He had also been nominated successor to the crown by the late king of Spain's will. But in a former treaty among the powers of Europe, Charles, son of the emperor of Germany, was appointed heir to that crown; and this treaty had been guarantee'd by France herself, though she now resolved to reverse that consent in favour of a descendant of the house of Bourbon. Charles was still farther led on to put in for the crown of Spain, by the invitation of the Catalonians, who declared in his favour; and, with the assistance of the British and Portuguese, promised to arm in his cause. Upon his way to his newly assumed dominion, he landed in England; where he was received on shore by the dukes of Somerset and Marlborough, who conducted him to Windsor. He was kindly received by the queen; and furnished with 200 transports, 30 ships of war, and 9200 men, for the conquest of that extensive empire. The earl of Peterborough, a man of romantic bravery, offered to conduct them; and his single service was reckoned equivalent to armies.

To these successes, however, very little regard was paid in Britain. The victories of the duke of Marlborough alone engaged their attention. In 1706, he opened the campaign with an army of 80,000 men. He was met by the French under Villeroy near the village of Ramillies*. An engagement ensued, in which the duke gained a victory almost as complete as that of Blenheim had been; and the whole country of Brabant was the reward of the victors. The French troops were now dispirited; the city of Paris was in confusion; Louis, who had long been flattered with conquest, was now humbled to such a degree as almost to excite the compassion of his enemies. He intreated for peace, but in vain; the allies carried all before them; and his very capital began to dread the approach of the conquerors. But what neither his armies nor his politics could effect, was brought about by a party in England. The dissension between the whigs and tories saved France that now seemed tottering on the brink of ruin.

The councils of the queen had hitherto been governed by a whig ministry; for though the duke of Marlborough started in the interest of the opposite party, he soon joined the whigs, as he found them most sincere in the design of humbling France. The people, however, were now in fact beginning to change, and a general spirit of toryism to take place. The queen's personal virtues, her successes, her deference for the clergy, and their great veneration for her, began to have a prevailing influence over the whole nation. People of every rank were not ashamed to defend the most servile tenets, when they tended to flatter or increase the power of the sovereign. They argued in favour of strict hereditary succession, divine right, and non-resistance to the regal power. The tories, though joining in vigorous measures against France, were never ardently their enemies: they rather secretly hated the Dutch, as of principles very opposite to their own; and longed for an opportunity of withdrawing from their friendship. They began to meditate schemes of opposition to the duke of Marlborough. Him they considered as a self-interested man, who sacrificed the real advantages of the nation, in protracting a ruinous war for his own private emolument and glory. They saw their country oppressed with an increasing load of taxes, which by a continuance of the war must inevitably become an intolerable burden. Their discontents began to spread, and the tories wanted only a few determined leaders to assist them in removing the present ministry.

In the mean time a succession of losses began to dissipate the conquering frenzy that had seized the nation in general, and to incline them to wish for peace. The earl of Galway, who commanded the army in Spain, was utterly defeated at Almanza† by the duke of Brwick; and in consequence of this victory, all Spain, except the province of Catalonia, returned to their duty to Philip their lawful sovereign. An attempt was made upon Toulon, by the duke of Savoy and

prince Eugene by land, and an English fleet by sea; but to no purpose. The fleet under Sir Cloudesly Shovel, having set sail for England, was driven by a violent storm on the rocks of Scilly. His own ship was lost, and every person on board perished. Three more ships met with the same fate; while three or four others were saved with the utmost difficulty. In Germany, marshal Villars the French general carried all before him, and was upon the point of restoring the elector of Bavaria. The only hopes of the people lay in the activity and conduct of the duke of Marlborough, who opened the campaign of 1707, about the middle of May; but even here they were disappointed. The duke declined an engagement; and after several marchings and countermarchings, both armies retired into winter quarters about the end of October. The French made vigorous preparations for the next campaign; and the duke returned to England to meet with a reception he did not at all expect, and which, as far as appears, he did not deserve.

The most remarkable transaction, however, of this year, and indeed of this whole reign, was the union between the two kingdoms of Scotland and England. Though governed by one sovereign since the time of James I. of England, yet each nation continued to be ruled by its respective parliament; and often professed to pursue opposite interests to those of its neighbour. The union had often been unsuccessfully attempted before, and had indeed been the cause of the bloody wars in the time of Edward I. and III. of England. In all the former proposals on that head, both nations were supposed to remain free and independent; each kingdom having its own parliament, and subject only to such taxes and other commercial regulations as those parliaments should judge expedient for the benefit of their respective states. After the destruction of the Darien colony, in the manner already related, King William had endeavoured to allay the national ferment by refusing the affair of an union with as much assiduity as his warlike disposition would allow. The terms proposed were the same with those formerly held out, viz. a federal union, somewhat like that of the states of Holland. With this view the Scots were prevailed on to send 20 commissioners to London; who, with 23 on the part of England, met at Whitehall in the month of October 1702. Here they were honoured with a visit from the queen, in order to enliven their proceedings and stimulate them to a more speedy dispatch of business: but the treaty was entirely broken off at this time by the Scottish commissioners insisting, that the rights and privileges of their countrymen trading to Africa and the Indies should be preserved and maintained. It was, however, resumed in the year 1706, when the commissioners again met on the 16th of April, in the council chamber of Whitehall. The Scottish commissioners still proposed a federal union; but the English were determined on an incorporation, which should not afterwards be dissolved by a Scottish parliament. Nothing but this, they said, could settle a perfect and lasting friendship betwixt the two nations. The commissioners from Scotland, however, still continued to resist that article which subjected their country to the same customs, excises, and regulations of trade as England; but the queen being persuaded to pay two visits in person to the commissioners,

commissioners,

Britain. missioners, exerted herself so vigorously that a majority was at last gained over; and all the rest yielded, though with reluctance, excepting Lockhart of Carnwath, who could not by any means be persuaded either to sign or seal the treaty.

363 The articles being fully prepared on the 22d of July, they were presented next day to her majesty by the lord-keeper, in the name of the English commissioners; at the same time that a sealed copy of the instrument was likewise delivered by the lord chancellor of Scotland. They were most graciously received; and the same day the queen dictated an order of council, threatening with prosecution such as should be concerned in any discourse or libel, or in laying wagers with regard to the union. Notwithstanding all this harmony, however, the treaty was received with the utmost disapprobation in Scotland. The terms had been carefully concealed, so that nothing transpired till the whole was at once laid before parliament. The ferment was then so general, that all ranks of people, however divided in other respects, united against this detested treaty. The nobility and gentry were exasperated at the annihilation of parliament, and the consequent loss of their influence and credit. The body of the people cried out, that the independence of the nation was sacrificed to treachery and corruption. They insisted that the obligation laid on their members to stay so long at London, in their attendance on the British parliament, would drain the country of its money, impoverish the members themselves, and subject them to the temptation of being corrupted. Nor was the commercial part of the people better satisfied. The dissolution of the India company, the taxes laid on the necessaries of life, the vast number of duties, customs, and restrictions, laid upon trade, were all of them matter of complaint. Before this time the trade of Scotland had been open to the Levant, the Baltic, France, Spain, Portugal, Holland, and the Dutch plantations; and it seemed difficult to conceive how the commerce of the country could be advanced by laying restrictions upon it to these places, especially as the compensation allowed, *viz.* the privilege of trading to the English plantations in America, must have been a very trifling advantage, when the amount of the whole exports to these places did not near equal the expence of defending them. The most violent disputes took place in the parliament. The lord Belhaven made a most pathetic speech, enumerating the miseries that would attend this treaty; which drew tears from the audience, and to this day is reckoned prophetic by many of the Scottish nation. Almost every article of the treaty was the subject of a protest; addresses against it were presented to parliament by the convention of royal boroughs, the commissioners of the general assembly, the company trading to Africa and the Indies, as well as from shires, stewartries, boroughs, towns, and parishes, without distinction of whig, tory, presbyterian, or episcopal.

Nor was the resentment of the common people without doors less than that of the members within. A coalition was formed betwixt the presbyterians and cavaliers; and to such a height did the resentment of the people arrive, that they chose officers, formed themselves into regiments, provided horses and ammunition, burnt the articles of union, justified their conduct by a

public declaration, and resolved to take the route to Edinburgh and dissolve the parliament.

In the mean time the privy council issued a proclamation against riots, commanding all persons to retire from the streets whenever the drum should beat; ordering the guards to fire on those who should disobey this command, and indemnifying them from all prosecution for maiming or slaying the rioters. Even these precautions were insufficient. The duke of Queensberry, the chief promoter of the union, though guarded by double lines of horse and foot, was obliged to pass through the streets at full gallop, amidst the curses and imprecations of the people, who pelted his guards, and even wounded some of his friends who attended him in the coach. In opposition to all this fury, the duke of Queensberry and others attached to the union magnified the advantages that would accrue to the kingdom from the union; they took off the resentment of the clergy, by promoting an act to be inserted in the treaty, by which the presbyterian discipline was to be the only government of the church of Scotland, unalterable in all succeeding times, and a fundamental article of the union. Emisaries were employed to dissuade the Cameronians from the Cavaliers, by demonstrating the absurdity, sinfulness, and danger, of such a proceeding. The India company was flattered with the prospect of being indemnified for the losses they had sustained, and individuals by sharing an equivalent. Their last manœuvre was to bring over a party in the Scots parliament, nicknamed the *Squadron Volante*, from their fluctuating between ministry and opposition, without attaching themselves to any party till the critical moment, which was either to cement both kingdoms by a firm union, or involve them in the calamities of war. By this unexpected stroke, the ministry obtained a decisive victory, and all opposition was vain. The articles of treaty were ratified by parliament, with some trifling variations, on the 25th of March 1707; when the duke of Queensberry finally dissolved that ancient assembly, and Scotland ceased to be a separate independent kingdom.

On the conclusion of the treaty, the queen informed both houses of the English parliament that the treaty of union, with some additions and alterations, was ratified by an act of the parliament of Scotland; that she had ordered it to be laid before them, and hoped it would meet their approbation. She observed, that they had now an opportunity of putting the last hand to a happy union of the two kingdoms; and that she should look upon it as a particular happiness if this great work, so often attempted before without success, could be brought to perfection in her reign. Objections, however, were flatted by the tory party; but they were at that time too weak to be heard with any attention. Sir John Parkington composed the new treaty to the marriage of a woman without her consent. It was an union carried on by corruption and bribery within doors, and by force and violence without. The promoters of it had barely betrayed their trust, by giving up their independent constitution; and he would leave it to the judgment of the house, whether or not men of such principles were fit to be admitted into their house of representatives. Lord Haverham, in the upper house, laid, the question was, Whether two nations, independent in their sovereignty,

ties, that had their distinct laws and interests, different forms of worship, church-government and order, should be united into one kingdom? He supposed it an union made up of so many incongruous ingredients, that should it ever take effect, it would require a standing power and force to keep them from falling asunder, and breaking in pieces every moment. Above an hundred Scottish peers, and as many commoners, he said, were excluded from sitting and voting in parliament, though they had as much right to sit there as any English peer had to sit and vote in the parliament of England. The union, he said, was contrary to the sense of the Scottish nation, the murmurs of the people had been so loud as to fill the whole kingdom, and had reached even the doors of parliament. That the government had issued a proclamation pardoning all slaughter, bloodshed, and maiming committed upon those who should be found in tumults; and from all these circumstances he concluded, that the people of Scotland were averse to an incorporating union, which, he supposed, would be a most dangerous expedient to both nations. All these arguments, however, were answered by those of the opposite party with such success, that the union was unalterably completed on the first of May 1707; and the island took the name of "The United Kingdom of Great Britain." The queen expressed the highest satisfaction when it received the royal assent, and said, "She did not doubt but it would be remembered and spoke of hereafter, to the honour of those who had been instrumental in bringing it to such a happy conclusion. She desired that her subjects of both kingdoms should, from henceforward, behave with all possible respect and kindness towards one another; that so it might appear to all the world they had hearts disposed to become one people." The first of May was appointed a day of public thanksgiving; and congratulatory addresses were sent up from all parts of England, excepting the university of Oxford. The Scots, however, were totally silent on the occasion.

In this treaty, it must be observed, that the commissioners on the part of England were not only able statesmen, but, for the most part, well skilled in trade, which gave them an evident advantage over those of Scotland, who consisted of lords and gentlemen who had no commercial knowledge. Hence they were over-matched by the former in the great objects which were to give the turn to national prosperity; though they were very careful to preserve all their heritable offices, superiorities, jurisdictions, and other privileges and trappings of the feudal aristocracy. Had the English commissioners made a liberal use of the advantages afforded them at this time, it would have been in their power greatly to have enriched themselves as well as the inhabitants of Scotland; "but instead of this (says Mr Knox), in negotiating with a ruined kingdom, they were influenced by the then narrow, short-sighted principle of commercial monopoly; and the consequences were such as might, with a small degree of reflection, have been foreseen. Instead of a solid compact, affording, upon the whole, reciprocal advantages, and which it would have been the inclination as well as interest of both nations to preserve inviolate, the concessions on the part of Scotland, and the restrictions on their trade, were so quickly and severely felt, that about the

sixth year after the ratification of the treaty, the sixteen peers who first represented Scotland in the upper house, though most of them had been the supporters of administration in promoting the union, unanimously moved for its dissolution. The motion was followed by a violent debate, in which, however, the Scottish peers were at last over-ruled, and thenceforth the nation submitted reluctantly to its fate. The metropolis, having no manufactures, now beheld itself deprived of its only support by the translation of the parliament to London. The trading towns pined under the duties and restrictions on their commerce; the whole kingdom, after so many fatal disasters, seemed completely ruined beyond recovery, and all degrees of men sunk under the weight of these complicated misfortunes. The first fruits of the treaty in Scotland was a board of customs and another of excise, with the appointment of commissioners, collectors, &c. with other necessary officers, who were immediately distributed over the several sea-ports and districts of the nation. In many parts they were roughly used, particularly the excise officers; and, in the Orkneys, the officers were so frightened by the country people, that for some time the business was obliged to be postponed."

In 1708, there was a warm debate in the grand committee of the house of lords, occasioned by a bill passed by the commons for rendering the union of the two kingdoms more entire and complete, whereby it was enacted, that, "from the first of May 1708, there should be but one privy council in the kingdom of Britain."—Of this affair Mr Cunningham gives a particular account, and informs us that he himself had a hand in the affair, and that he had "from his youth borne a just hate to the privy council of Scotland." The arguments for the dissolution were its enormous stretches of power and acts of cruelty; that it could now be of no other use in Scotland, than that the court might thereby govern every thing at pleasure, and procure such members of parliament as they thought proper; against which both Scots and English ought now carefully to guard themselves. On the other hand, it was argued, that the abuse of the power complained of was no argument for the entire dissolution of the council, though it was for a restriction and limitation of it; that it was necessary that a privy council should remain in Scotland, out of regard to the ancient customs of the country, and to restrain the rage of the people which was then ready to break out beyond all bounds. The dissolution, however, was carried by 50 against 40; after which the nation, being deprived of this last fragment of their ancient government, the opposers of the union raised the animosities of the people to a dangerous height; but the ferment abated after an ineffectual attempt in favour of the pretender.

We must now return to the duke of Marlborough, who had gone over to Flanders, where he seemed resolved to push his good fortune. Peace had been offered more than once; treaties entered upon, and as often frustrated. After the battle of Ramillies, the king of France had employed the elector of Bavaria to write letters in his name to the duke of Marlborough, containing proposals for opening a congress. He offered to give up either Spain and its dominions, or the kingdoms of Naples and Sicily, to Charles of Austria, and to give a barrier to the Dutch in the Netherlands. But these terms were

364

366
French defeated at Oudenarde.

Britain. were rejected. The two armies once more met in numbers newly equal at Oudenarde (a). An engagement ensued, in which the French were defeated, and Lille (b) the strongest town in Flanders, Gent, Bruges, and all the other towns in that country, soon after fell into the hands of the victors. The campaign ended with fixing a barrier to the Dutch provinces, and it now only remained to force a way into the provinces of the enemy.

The French king, being now in a manner reduced to despair, again sued for peace; but the demands of the allies were so high, that he was obliged to reject them, and prepare for another campaign. This was in the year 1709. The first attempt of the allies was on the city of Tournay, garrisoned by 12,000 men, and exceedingly strong both by nature and art. After a terrible siege of 21 days, the town capitulated; and a month afterwards the citadel, which was still stronger than the town. Next followed the bloody battle of Malplaquet †; where the allied army, consisting of 110,000 men, attacked the French consisting of 120,000, strongly posted and fortified in such a manner that they seemed quite inaccessible. Nothing, however, was able to stand before the allied army; they drove the French from their fortifications: but their victory cost them dear; 20,000 of their best troops lay dead on the field of battle (c). The consequence of this victory was the surrender of the city of Mons, which ended the campaign.

The last campaign of the duke of Marlborough, which happened in the year 1711, is said to have excelled all his former exploits. He was opposed by the marshal Villars, the same who had commanded the French in the battle of Malplaquet. He contrived his measures so, that, by marching and countermarching, he induced the enemy to quit a strong line of entrenchments without striking a blow, which he came afterwards and took possession of. This enterprize was followed by the taking of Bouchain, which was the last military achievement of this great general. By a continuance of conduct and success almost unparalleled, he had gained to the allies a prodigious tract of country. From the beginning of the war, which had now continued nine years, he had perpetually advanced, and never retreated before his enemies, nor lost an advantage he had obtained over them. He most frequently gained the enemy's posts without fighting; but where

he was obliged to attack, no fortifications were able to resist him. He had never besieged a city which he did not take, nor engaged in a battle in which he did not come off victorious. This the allies had in success under their command Spanish Guelderland, Limbourg, Brabant, Flanders, and Hainault; they were masters of the Scheldt, the capture of Bouchain had opened for them a way into the heart of France, and another campaign might have made them masters of Paris: but on the duke's return from this campaign, he was accused of having taken a bribe of 6000 l. a year from a Jew ^{He is said to} who had contracted to supply the army with bread; and the queen thought proper to dismiss him from all ^{his employments} his employments.

On the removal of this great general the command of the British forces was given to the duke of Ormond. The transactions which followed, as represented by Mr Cunningham, are by no means favourable to the character of the British nation. He represents the people at large as blinded by an headstrong and furious clergy, who wished to revive the absurdities of the Romish religion, and to unite the English and Gallian churches; the general of the army acting a most infidious part, by giving the enemy intelligence of the designs of the allies before he declared that he was not to act in concert with them; and the queen herself as commanding him to act such a shameful part, nay as acting in a similar manner herself. Prince Eugene complained much of the inactivity of the English general, though he seemed to be unacquainted with his treachery; while the whole army loaded him with execrations, calling him "a stupid tool, and a general of straw." All this, however, was in vain; the duke continued to prefer the commands of his sovereign to every other consideration.

The disgrace of the duke of Marlborough had been owing to the prevalence of the tory party, who had now got the whig ministry turned out: the consequence of this was, that in spite of all the remonstrances, memorials, &c. of the allies, the British army in Flanders was ordered not to act offensively. Hence the operations languished, a considerable body of the allies was cut off at Denain, and the French re-took some towns. A peace was at last ³⁷¹ concluded in 1713, between France and Britain. ^{Peace was} In this treaty it was stipulated, that Philip, now acknowledged king of Spain, should renounce all right ^{to}

(A) In this engagement the electoral prince of Hanover, afterwards George I. of Britain, greatly distinguished himself, and gained the whole glory of the first attack. In the engagement his horse was killed under him, and colonel Lufchki close by his side. "On that day (says Cunningham), this excellent young prince discovered such courage as no man living ought to forget, and as all posterity will never surpass."

(B) At the siege of Lille, Cunningham relates the following anecdote of the magnanimity of a common soldier. "This man had the good fortune to take prisoner major general Colbert, brother to the marquis de Torey. The prisoner, greatly taken with the clemency, humanity, and good behaviour of the soldier, offered him 200 louis d'ors, and a captain's post for life, if he would give him his liberty. The soldier, however, resisted the temptation, alleging the dishonour that would attend such conduct; and asking him at the same time, how, when raised to the rank of a captain, he could look his general in the face for whom he had fought for so many years?—This instance of fidelity weighed so much with prince Eugene and the duke of Marlborough, that the former made him a present, and the latter gave him a captain's commission."

(C) Cunningham differs prodigiously from this account. His computation bears no more than 6000 killed and 9000 wounded on the part of the allies, and 7000 killed and 10,000 wounded on the part of the French.

Britain.

to the crown of France, the union of two such powerful kingdoms being thought dangerous to the liberties of Europe. It was agreed, that the duke of Berry, Philip's brother, and after him in succession, should also renounce his right to the crown of Spain, in case he became king of France. It was stipulated, that the duke of Savoy should possess the island of Sicily, with the title of *king*; together with Fenestrelles, and other places on the continent; which increase of dominion was in some measure made out of the spoils of the French monarchy. The Dutch had the barrier granted them which they so much desired; and if the crown of France was deprived of some dominions to enrich the duke of Savoy, on the other hand the house of Austria was taxed to supply the wants of the Hollanders, who were put in possession of the strongest towns in Flanders. The fortifications of Dunkirk were demolished. Spain gave up Gibraltar and the island of Minorca. France resigned her pretensions to Hudson's bay, Nova Scotia, and Newfoundland; but was left in possession of Cape Britain, and the liberty of drying fish upon the shore. Among the articles glorious to the British nation, their settling free the French Protestants confined in the prisons and galleys for their religion, was not the least meritorious. For the emperor it was stipulated, that he should possess the kingdom of Naples, the duchy of Milan, and the Spanish Netherlands. The king of Prussia was to have Upper Guelder; and a time was fixed for the emperor's acceding to these articles, as he had for some time obstinately refused to assist at the negociation. This famous treaty was signed at Utrecht on the last day of March 1713.

This year was also remarkable for an attempt of the Scottish peers and commons to dissolve the union, which, as has been observed, had proved exceedingly disagreeable and distressful to the nation. During the debates on this subject, the earl of Peterborough endeavoured to prove the impossibility of dissolving the treaty, which he compared to a marriage, that, being once contracted, could not be dissolved by any power on earth. He observed, that though England, who, in the national marriage, must be supposed to represent the husband, had in some instances been unkind to the lady, she ought not presently to sue for a divorce; and added, when the union was termed a mere political expedient, that it could not have been made more solemn, unless, like the ten commandments, it had come from heaven. The duke of Argyle also, who had originally promoted the union, now declared against it, and said, that unless it were dissolved he did not long expect to have either property left in Scotland or liberty in England. By some other peers it was alleged that the union had not produced its intended effect; that it had been designed to promote friendship between the two nations; but, so far from answering the purpose, the animosities between them were never so great as then; and if they were separated again they would be better friends. This motion was over-ruled in the house; but the discontent of the people still continued, and addresses were prepared throughout the kingdom, and matters were in danger of coming to the worst extremities, when the attempt of the pretender in 1715 so divided the minds of the people, that no unanimous effort could ever afterwards be made; though the union was long generally

considered, and still is by some individuals, as a national grievance.

Britain.

The history of the latter part of this reign consists entirely of the intrigues of the whigs and Tories against each other; which, as they are now of no importance, it is needless to take up time in relating, further than that the Tory influence continued to prevail. Whether the ministry at this time wished to alter the succession from the Hanoverian line, cannot now be clearly made out; but certain it is, that the whigs firmly believed it, and the Tories but faintly denied the charge. The suspicions of the former became every day stronger, particularly when they saw a total removal of the whigs from all places of trust and confidence throughout the kingdom, and their employments bestowed on professed Tories, supposed to be maintainers of an unbroken hereditary succession.

372
Attempt to
dissolve the
union.

The violent dissensions between these two parties, their unbounded licentiousness, cabals, and tumults, made the queen's situation very disagreeable; her health declined; and on the 28th of July 1714, she fell into a lethargic insensibility. Notwithstanding all the medicines the physicians could prescribe, the distemper gained ground so fast, that next day they despaired of her life. All the members of the privy council, without distinction, were now summoned from the different parts of the kingdom; and they began to provide for the security of the constitution. A letter was sent to the elector of Hanover, informing him of the queen's desperate situation, and desiring him to repair to Holland, where he would be attended by a British squadron to convey him to England. At the same time they dispatched instructions to the earl of Strafford at the Hague, to desire the States-general to be ready to perform the guaranty of the Protestant succession. Precautions were taken to secure the sea-ports; and the command of the fleet was bestowed upon the earl of Berkeley, a professed whig. These measures, which were all dictated by that party, answered a double end. They argued the alacrity of the whigs in the cause of their new sovereign, and seemed to imply that the state was in danger from the disaffection of the opposite party.

373
Death of
the queen.

On the 30th of July the queen seemed to be somewhat relieved by the medicines which had been given her. She rose from her bed about eight in the morning, and walked a little. After some time, casting her eyes on a clock that stood in her chamber, she continued to gaze at it for some minutes. One of the ladies in waiting asked her what she saw there more than usual? to which the queen only answered by turning her eyes upon her with a dying look. She was soon after seized with an apoplectic fit; from which, however, she was somewhat recovered by the assistance of Dr Mead. She continued all night in a state of stupor. She gave some signs of life betwixt twelve and one the next day; but expired the following morning, a little after seven o'clock, having lived 49 years, and reigned upwards of 12. This princess was remarkable neither for her learning nor her capacity. Like all the rest of her family, she seemed rather fitted for the duties of private life than a public station; being a pattern of conjugal fidelity, a good mother, a warm friend, and an indulgent mistress; and to her honour it certainly must be recorded, that during her

Britain. reign none suffered on the scaffold for treason. In her ended the line of the Stuarts; a family who never rewarded their friends, nor ever avenged them of their adversaries; a family whose misfortunes and misconducts are not to be paralleled in history.

374
e is suc-
ceded by
George I.
The queen had no sooner resigned her breath than the privy-council met, and three instruments were produced, by which the elector of Hanover appointed several of his known adherents to be added as lords, justices to the seven great officers of the kingdom. Orders also were immediately issued out for proclaiming George king of England, Scotland, and Ireland. The regency appointed the earl of Dorset to carry him the intimation of his accession to the crown, and to attend him in his journey to England. They sent the general officers, in whom they could confide, to their posts; they reinforced the garrison of Portsmouth, and appointed the celebrated Mr Addison secretary of state. No tumult, no commotion, arose against the accession of the new king; and this gives a strong proof that the Tories, had they really intended to exclude him, never took any rational measures to accomplish their purpose.

375
c arrives
England
The king first landed at Greenwich; where he was received by the duke of Northumberland, captain of the life-guard, and the lords of the regency. From the landing-place he walked to his house in the park, accompanied by a great number of the nobility and other persons of distinction, who expected to make their court in this reign in consequence of their turbulence and opposition to the reigning party in the last. George I. was 54 years old when he ascended the British throne. His mature age, his sagacity and experience, his numerous alliances, and the general tranquillity of Europe, all contributed to establish his interests, and promise him a peaceable and happy reign. His virtues, though not shining, were solid; and he was of a very different disposition from the Stuart family whom he succeeded. These were known to a proverb for leaving their friends in extremity; George, on the contrary, soon after his arrival in England, was heard to say, "My maxim is, never to abandon my friends, to do justice to all the world, and to fear no man." To these qualities of resolution and perseverance, he joined great application to business. One fault, however, with regard to England, remained behind: he studied the interests of the kingdom he had left more than of those he came to govern.

376
c favours
c whigs.
The new king soon discovered his inclination to support those who had raised him to the throne, that is, the whig party. When he retired to his bed-chamber, after his first landing, he sent for such of the nobility as had distinguished themselves by their zeal for his succession. He expressed the greatest regard for the duke of Marlborough just then arrived from the continent, whither he had been driven by the violence of the Tories. The same friendship he professed for the other leaders of the whigs; but the Tories found themselves excluded from the royal favour. The king did not seem sensible that the monarch of a faction rules but one half of his subjects. It was his misfortune, and consequently that of the nation, that he was hemmed round by men who soured him with all their own interests and prejudices. The whigs, while they pretended to secure the crown for the king, were using all

Britain. their art to confirm their own interests, extend their connections, and give laws to their sovereign. An instantaneous change was made in all the offices of trust, honour, or advantage. The names of the contending parties were changed into those of *Hanoverians* and *Jacobites*. The former governed the senate and court, oppressed whom they would, bound the lower orders of people by severe laws, and kept them at a distance by vile distinctions; and then taught them to call this *liberty*.

377
National
disorders.
In consequence of these partialities, the highest dissensions were raised through the whole kingdom. The Tories or Jacobites raised the most terrible outcries; and had the pretender been a man of any judgment or abilities, a fair opportunity was now offered him of striking a decisive blow. Instead of this, he continued a calm spectator on the continent, and only sent over his emissaries to disperse ineffectual manifestoes and delude the unwary. In these papers he observed, that the late queen had intentions of calling him to the crown. He expostulated with his people upon the injustice they had done themselves in proclaiming a foreign prince for their sovereign, contrary to the laws of the country, that gave him alone the real claim. Copies of a printed address were sent to the dukes of Shrewsbury, Marlborough, Argyle, and other noblemen of the first distinction; vindicating his right to the crown, and complaining of the injustice of his people. Yet, though he still complained of their conduct, he never took any step to correct his own, or remove that obstacle by which his father had lost his throne. He still continued to profess the truest regard to the Catholic religion; and, instead of concealing his sentiments on that head, gloried in his principles.

But, however much the Popish religion was at that time hated in England, the principles of the dissenters were not in the least more agreeable to the generality. The Tories affirmed, that, under a whig administration, heresy and impiety were daily gaining ground. The lower orders of the clergy joined in these complaints, and pointed out several tracts published in favour of Arianism and Socinianism. The ministry not only refused to punish the delinquents, but silenced the clergy themselves, and forbade their future disputations on these topics.—The parliament was now dissolved, and another called by a very extraordinary proclamation, in this the king complained of the evil designs of men disaffected to his succession; and of their having misrepresented his conduct and principles. He expressed his hopes, that his subjects would send up to parliament the fittest persons to redress the present disorders. He intreated that they would elect such in particular as had expressed a firm attachment to the Protestant succession when it was in danger. In the election of this important parliament, uncommon vigour was exerted on both sides; but by dint of the moneyed interest that prevailed in corporations, and the activity of the ministry, a great majority of whigs was returned both in England and Scotland.

379
y. vide
proceedings
of the new
Parliament.
Upon the first meeting of this new parliament, the most violent measures were resolved upon against the late ministry. Part of them kept away from business. A committee was appointed to inspect all the papers relative to the late treaty, and to pick out such of them as might serve for grounds of accusation against

Britain. the late ministry. The earl of Oxford was impeached of high treason, and sent to the Tower. The violence of the commons was answered with equal violence without doors. Tumults became every day more frequent, and every tumult served only to increase the severity of the legislature. They now passed an act, declaring, that if any persons to the number of 12, unlawfully assembled, should continue together one hour after being required to disperse by a justice of peace or other officer, and after hearing the act against riots read in public, they should be deemed guilty of felony without benefit of clergy. This is a very severe act, and one of the greatest restrictions on the liberty of the subject that has passed during this century; as, by it, all meetings of the people, either for the purposes of amusement or redress, are rendered criminal, if it shall please any magistrate to consider them as such.

380
Rebellion
in Scotland.

These vindictive proceedings excited the indignation of the people, who perceived that the avenues of royal favour were closed to all but a faction. A rebellion commenced in Scotland, where to their other grievances they joined that of the union, which they were taught to consider as an oppression. The malecontents of this country had all along maintained a correspondence with their friends in England, who were now driven by resentment and apprehension into a system of politics they would not otherwise have dreamed of. Some of the tory party, who were men attached to the Protestant religion, and of moderate principles in government, began to associate with the Jacobites, and to wish in earnest for a revolution. Scotland first showed them the example. The earl of Mar, assembling 300 of his vassals in the Highlands, proclaimed the pretender at Castleton; and setting up his standard at Braemar, assumed the title of *lieutenant-general of his majesty's forces*. To second these attempts, two vessels arrived from France, with arms, ammunition, and a number of officers, together with assurances to the earl, that the pretender himself would shortly come over to head his own forces. In consequence of this promise, the earl soon found himself at the head of 10,000 men well armed and provided. He secured the pass of Tay at Perth, where his head-quarters were established; and made himself master of the whole province of Fife, and all the sea-coast on that side of the frith of Forth. He marched from thence to Dumblain, as if he had intended to cross the Forth at Stirling-bridge; but there he was informed that the duke of Argyle, who on this occasion was appointed commander in chief of all the forces in North Britain, was advancing against him from Stirling with all his own clans, assisted by some troops from Ireland. Upon this, he thought proper at first to retreat; but being soon after joined by some of the clans under the earl of Seaforth, and others under general Gordon, an experienced officer, who had signalized himself in the Russian service, he resolved to face the enemy, and directed his march towards the south.

331
Battle near
Dumblain.

The duke of Argyle, apprized of his intentions, and at any rate willing to prove his attachment to the present government, resolved to give him battle in the neighbourhood of Dumblain, though his forces did not amount to half the number of the enemy. In the morning, therefore, he drew up his army, which did not exceed 3500 men, in order of battle; but he soon found

Britain. himself greatly outflanked by the insurgents. The duke, therefore, perceiving the earl make attempts to surround him, was obliged to alter his disposition, which, on account of the scarcity of general officers, was not done so expeditiously as to be finished before the rebels began the attack. The left wing of the duke's army received the centre of the enemy, and supported the first charge without shrinking. It seemed even for a while victorious, and the earl of Clanronald was killed. But Glengary, who was second in command, undertook to inspire his intimidated forces with courage; and, waving his bonnet, cried out several times, *Revenge!* This animated the rebel troops to such a degree, that they followed him close to the points of the enemies bayonets, and got within their guard. A total rout began to ensue of that wing of the royal army; and general Wetham, their commander, flying full speed to Stirling, gave out that the rebels were completely victorious. In the mean time, the duke of Argyle, who commanded in person on the right, attacked the left of the enemy; and drove them before him two miles, though they often faced about and attempted to rally. Having thus entirely broken that wing, and driven them over the river Allan, he returned back to the field of battle; where, to his great mortification, he found the enemy victorious, and patiently waiting for the assault. However, instead of renewing the engagement, both armies continued to gaze at each other, neither caring to begin the attack. In the evening, both parties drew off, and both claimed the victory. All the advantages of a victory, however, belonged to Argyle. He had interrupted the progress of the enemy; and, in their circumstances, delay was defeat. In fact, the earl of Mar soon found his losses and disappointments increase. The castle of Inverness, of which he was in possession, was delivered up by lord Lovat, who had hitherto professed to act in the interest of the pretender. The marquis of Tullibardine forsook the earl, in order to defend his own part of the country; and many of the clans seeing no likelihood of coming to a second engagement, returned quietly home.

In the mean time, the rebellion was still more unsuccessfully prosecuted in England. From the time the pretender had undertaken this wild project at Paris, in which the duke of Ormond and lord Bolingbroke were engaged, lord Stair, the English ambassador there, had penetrated all his designs, and sent faithful accounts of all his measures and of all his adherents to the ministry at home. Upon the first rumour, therefore, of an insurrection, they imprisoned several lords and gentlemen, of whom they had a suspicion. But these precautions were not able to stop the insurrection in the western counties, where it was already begun. All their preparations, however, were weak and ill conducted; every measure was betrayed to government as soon as projected, and many revolts were repressed in the very outset. The university of Oxford was treated with great severity on this occasion. Major-general Pepper, with a strong detachment of dragoons, took possession of the city at day-break, declaring that he would instantly shoot any of the students who should presume to appear without the limits of their respective colleges.

382
Bad conduct
of James's
party.

The insurrection in the northern counties came to greater

Britain. greater maturity. In the month of October 1715, the earl of Derwentwater, and Mr Forster, took the field with a body of horse, and, being joined by some gentlemen from the borders of Scotland, proclaimed the pretender. Their first attempt was to seize upon Newcastle, in which they had many friends; but finding the gates shut against them, they retired to Hexham. To oppose these, general Carpenter was detached by government with a body of 900 men, and an engagement was hourly expected. The rebels had two methods by which they might have conducted themselves with prudence and safety. The one was to march directly into the western parts of Scotland, and there join general Gordon, who commanded a strong body of Highlanders. The other was to cross the Tweed, and boldly attack General Carpenter, whose forces did not exceed their own. From the insatiation attendant on the measures of that party, neither of these counsels was pursued. They took the rout to Jedburgh, where they hoped to leave Carpenter on one side, and penetrate into England by the western border. This was the effectual means to cut themselves off either from retreat or assistance. A party of Highlanders, who had joined them by this time, at first refused to accompany them in such a desperate incursion, and one half of them actually returned to their own country. At Brampton, Mr Forster opened his commission of general, which had been sent him by the earl of Mar, and there he proclaimed the pretender. They continued their march to Penrith, where the body of the militia that was assembled to oppose them fled at their appearance. From Penrith they proceeded by the way of Kendal and Lancaster to Preston, of which place they took possession without any resistance. But this was the last stage of their ill-advised excursion: for general Wills, at the head of 7000 men, came up to attack them; and from his activity there was no escaping. They now, therefore, began to raise barricades about the town, and to put the place in a posture of defence, repelling the first attacks of the royal army with success. Next day, however, Wills was reinforced by Carpenter, and the town was invested on all sides. In this deplorable situation, to which they were reduced by their own rashness, Forster hoped to capitulate with the general; and accordingly sent colonel Oxburgh, who had been taken prisoner, with a trumpeter to propose a capitulation. This, however, Wills refused; alleging that he would not treat with rebels, and that the only favour they had to expect was to be spared from immediate slaughter. These were hard terms, but no better could be obtained. They accordingly laid down their arms, and were put under a strong guard. All the noblemen and leaders were secured, and a few of their officers tried for deserting from the royal army, and shot by order of a court-martial. The common men were imprisoned at Chester and Liverpool; the noblemen and considerable officers were sent to London, and led through the streets pinioned and bound together, to intimidate their party.

385
 of the

 ance.

Though the schemes of the pretender appear to have been foolishly enough conducted in Britain, yet they were much more so in France. Bolingbroke had been made his secretary at Paris, and Ormond his prime minister. But these statesmen quickly found that no-

thing could be done in favour of his cause. The king of France, who had ever espoused the interest of the abdicated family, was just dead; and the duke of Orleans, who succeeded in the government of the kingdom, was averse to lending the pretender any assistance. His party, however, which was composed of the lowest and the most ignorant exiles from the British dominions, affected the utmost confidence, and boasted of a certainty of success. The deepest secrets of his cabinet, and all his intended measures, were bandied about in coffee-houses by persons of the lowest rank both in fortune and abilities. Subaltern officers resolved to be his generals; and even prostitutes were entrusted to manage his negotiations. Little therefore could be expected from such assistants and such councils.

386
 Pro-
 under
 in
 Scotland;

Though, by this time, the pretender might easily have seen that his affairs were desperate; yet, with his usual insatiation, he resolved to hazard his person among his friends in Scotland, at a time when such a measure was too late for success. Passing, therefore, through France in disguise, and embarking in a small vessel at Dunkirk, he arrived, after a voyage of a few days, on the coasts of Scotland, with only six gentlemen in his train. He passed unknown through Aberdeen to Peterhead, where he was met by the earl of Mar, and about 30 noblemen and gentlemen of the first quality. There he was solemnly proclaimed; and his declaration, dated at Comerey, was printed and dispersed. He went from thence to Dunlee, where he made a public entry; and in two days more he arrived at Scoon, where he intended to have the ceremony of his coronation performed. He ordered thanksgivings to be made for his safe arrival; he enjoined the ministers to pray for him in their churches; and without the smallest share of power, went through the ceremonies of royalty, which threw an air of ridicule on all his conduct. Having thus spent some time in unimportant parade, he resolved to abandon the enterprise with the same levity with which it was undertaken. Having made a speech to his grand council, he informed them of his want of money, arms, and ammunition, for undertaking a campaign, and therefore deplored that he was obliged to leave them. He once more embarked on board a small French ship that lay in the harbour of Montrose, accompanied with several lords, his adherents; and in five days arrived at Graveline.

General Gordon, who was left commander in chief of the forces, with the assistance of earl Marischal, proceeded at their head to Aberdeen, where he secured three vessels to sail northward, which took on board such persons as intended to make their escape to the continent. He then continued his march through the Highlands, and quietly dismissed his forces as he went forward. This retreat was made with such expedition, that the duke of Argyle, with all his activity, could never overtake his rear, which consisted of 1000 horse.

387
 of the
 me's
 rty in
 ance.

The rebellion being ended, the law was put in force with all its terrors; and the prisons of London were crowded with those deluded persons, whom the ministry seemed resolved not to pardon. The commons, in their address to the crown, declared they would prosecute, in the most rigorous manner, the authors of the late rebellion; and their motions were a vindictive as their resolutions were speedy. The earls of

Derwentwater, Nithsdale, Carnwath, and Wintown, the lords Widrington, Kenmuir, and Nairne, were impeached; and, upon pleading guilty, all but lord Wintown, received sentence of death. No intreaties could prevail upon the ministry to spare these unhappy men. The house of lords even presented an address to the throne for mercy, but without effect; the king only answered, that on this, as on all other occasions, he would act as he thought most consistent with the dignity of the crown and the safety of the people. Orders were accordingly dispatched for executing the lords Derwentwater, Nithsdale, and Kenmuir, immediately; the rest were respited to a farther time. Nithsdale, however, had the good fortune to escape in woman's clothes that were brought him by his mother the night before his execution. Derwentwater and Kenmuir were brought to the scaffold on Tower-hill at the time appointed. Both underwent their sentence with calm intrepidity, and seemingly less moved than those who beheld them.

An act of parliament was next made for trying the private prisoners in London, and not in Lancashire where they were taken in arms. This was considered, by some of the best lawyers, as an alteration of the ancient constitution of the kingdom, by which it was supposed, that every prisoner should be tried in the place where the offence was committed, as a jury of neighbours would be best qualified to enter into the nature of the offence. In the beginning of April, commissioners for trying the rebels met in the court of common pleas, when the bills were found against Mr Forster, Mr Macintosh, and 20 of their confederates. Forster escaped from Newgate, and reached the continent in safety; the rest pleaded not guilty. Pitts the keeper of Newgate, being suspected of having conspired at Forster's escape, was tried for his life, but acquitted. After this, Macintosh, and several other prisoners, broke from Newgate, after having mastered the keeper and turnkey, and disarmed the sentinel. The court proceeded to the trial of those that remained; four or five were hanged, drawn, and quartered, at Tyburn. The judges appointed to try the rebels at Liverpool found a considerable number of them guilty of high treason. Two-and-twenty were executed at Manchester and Preston; about 1000 experienced the king's mercy, if such it may be called, to be transported to North America.

The rebellion being thus extinguished, the danger of the state was made a pretence for continuing the parliament beyond the term fixed for its dissolution. An act, therefore, was made by their own authority, repealing that by which they were to be dissolved every third year, and the term of their duration was extended to seven years. This attempt in any delegated body of people to increase their own power by extending it, is contrary to the first principles of justice. If it was right to extend their duration to seven years, they might also perpetuate their authority; and thus cut off even the shadow of a nomination. The bill, however, passed both houses, and all objections to it were considered as disaffection. The people might murmur at this encroachment, but it was too late for redress.

Domestic concerns being thus adjusted, the king resolved upon a voyage to the continent. He foresaw a storm gathering from Sweden. Charles XII. was

highly provoked against him for having entered into a confederacy with the Russians and Danes during his absence at Bender, and for having purchased from the king of Denmark the towns of Bremen and Verden, which constituted a part of his dominions. In consequence of this, Charles maintained a close correspondence with the dissatisfied subjects of Great Britain; and a scheme was formed for landing a considerable body of Swedish forces, with the king at their head, in some part of the island, where it was expected they would be joined by all the malecontents in the kingdom. Count Gyllenburg, the Swedish minister in London, was peculiarly active in the conspiracy; but being seized, with all his papers, by order of the king, the confederacy was broke for that time. A bill, however, was passed by the commons, forbidding all commerce with Sweden; the trade with which country was at that time of the utmost consequence to the English merchants. George having passed through Holland to Hanover, in order to secure his German dominions, entered into a new treaty with the Dutch and the regent of France, by which they agreed mutually to assist each other in case of an invasion; and for his further security, the commons granted him 250,000*l*. But the death of the Swedish monarch, who was soon after killed at the siege of Frederichshall in Norway, put an end to all inquietude from that quarter.

Among the many treaties for which this reign was remarkable, one had been concluded, which was called the *quadruple alliance*. It was agreed between the emperor, France, Holland, and Britain, that the emperor should renounce all pretensions to the crown of Spain, and exchange Sardinia for Sicily with the duke of Savoy; that the succession to the duchies of Tuscany, Parma, and Placentia, should be settled on the queen of Spain's eldest son, in case the present possessors should die without male issue. This treaty, however, was by no means agreeable to the king of Spain; and consequently it became prejudicial to the English, as it interrupted the commerce with that kingdom. A war soon after commenced between Spain and the emperor, who was considered as the principal contriver of the treaty; and a numerous body of Spanish forces were sent into Italy to support Philip's pretensions in that quarter. The regent of France attempted in vain to dissuade him, and the king of Britain offered his mediation with the like bad success; their interposition was considered as partial and unjust. A Spanish war was then resolved on. A squadron of 22 ships was equipped with all expedition, the command of which was given to Sir George Byng, and ordered to sail for Naples, at that time threatened with a Spanish army. He was received with the greatest joy by the Neapolitans; who informed him that the Spaniards, to the amount of 30,000, were then actually landed in Sicily. In this exigence, as no assistance could be given by land, he resolved to sail thither, fully determined to pursue the Spanish fleet on which the army was embarked. Upon coming round Cape Faro, he perceived two small Spanish vessels; and pursuing them closely, they led him to their main fleet, which, before noon, he discovered in line of battle, amounting in all to 27 sail. The Spaniards, however, notwithstanding of their superiority in number, attempted to sail away: but finding it impossible to make their escape, they kept

Britain

up a running fight, and the commanders behaved with great courage and activity; in spite of which they were all taken except three, which were preserved by the conduct of one Camroe, their vice-admiral, a native of Ireland. Sir George Byng behaved on this occasion with great prudence and resolution; and the king wrote him a letter with his own hand, approving his conduct.

nine millions and an half of money; for which they granted at the rate of 6 per cent. interest. As this company was not the only one to which government was indebted, Sir Robert Walpole formed a design of lessening the national debts, giving the several companies an alternative either of accepting a lower interest, namely 5 per cent. or of being paid the principal. The different companies chose rather to accept of the diminished interest than to be paid the principal. The South-sea company, in particular, having augmented their loan to ten millions, were contented to receive 500,000l. annually as interest, instead of 600,000l. which they usually received. In the same manner, the governors and company of the bank, and other companies, were contented to receive a diminished annual interest for their respective loans; all which greatly lessened the debts of the nation.

Britain

392
intended
invasion by
the Spaniards.

The rupture with Spain was thought to be favourable to the interests of the pretender; and it was hoped that by the assistance of cardinal Alberoni the Spanish minister, a new insurrection might be excited in England. The duke of Ormond was the person fixed upon to conduct this expedition; and he obtained from the Spanish court a fleet of ten ships of war and transports, having on board 6000 regular troops, with arms for 12,000 more. But fortune was still as unfavourable as ever. Having set sail, and proceeded as far as Cape Finisterre, he was encountered by a violent storm, which disabled his fleet, and frustrated the expedition. This misfortune, together with the bad success of the Spanish arms in Sicily and other parts of Europe, induced Philip to wish for a cessation of arms; and he at last consented to sign the quadruple alliance, by which means peace was again restored to Europe.

In this situation of things, one *Blount* a scrivener proposed to the ministry, in the name of the South-sea company, to buy up all the debts of the different companies, and thus for the South-sea company to become the sole creditors of the state. The terms he offered to government were extremely advantageous. The South-sea company was to redeem the debts of the nation out of the hands of the private proprietors who were creditors to the government, upon whatever terms they could agree on; and for the interest of this money which they had thus redeemed and taken into their own hands, they would be contented to be allowed by government 5 per cent. for six years; after which the interest should be reduced to 4 per cent. and should at any time be redeemable by parliament. For these purposes a bill passed both houses. But now came the part of the scheme big with fraud and ruin. As the directors of the South-sea company could not of themselves be supposed to possess so much money as was sufficient to buy up the debts of the nation, they were empowered to raise it by opening a subscription to an imaginary scheme for trading in the South seas; from which commerce immense advantages were promised, and still greater expected by the rapacious credulity of the people. All the creditors of government, therefore, were invited to come in, and exchange their securities, viz. the security of government, for that of the South-sea company. The directors books were no sooner opened for the first subscription, than crowds came to make the exchange of government stock for South-sea stock. The delusion was artfully continued and spread. Subscriptions in a few days sold for double the price they had been bought at. The scheme succeeded beyond even the projector's hopes, and the whole nation was infected with a spirit of avaricious enterprise. The insatiation prevailed; the stock increased to a surprising degree, even to near ten times the value of what it was first bought for.

393
Irish parliament
made
dependent
on that of
Britain.

Tranquillity being thus established, the ministry proceeded to secure the dependency of the Irish parliament on that of England. One *Maurice Annesley* had appealed to the house of peers of England from a decree made by the Irish peers, and their decree was reversed. The British peers ordered the barons of exchequer in Ireland to put *Mr Annesley* in possession of the lands he had lost by the decree of the lords in that kingdom. The barons obeyed this order; and the Irish peers passed a vote against them, as having attempted to diminish the just privileges of the parliament of Ireland; and at the same time ordered the barons to be taken under the custody of the black rod. On the other hand, the house of lords in England resolved, that the barons of the exchequer in Ireland had acted with courage and fidelity; and addressed the king to signify his approbation of their conduct, by some marks of his favour. To complete their intention, a bill was prepared, by which the Irish house of lords was deprived of all right of final jurisdiction. This bill was opposed in both houses, but particularly by the commons. It was there asserted by *Mr Pitt*, that it would only increase the power of the English peers, who were already but too formidable. *Mr Hungerford* demonstrated, that the Irish lords had always exerted their power of finally deciding causes. Notwithstanding all opposition, the bill was carried by a great majority, and soon after received the royal assent.

This blow was severely felt by the Irish; but was by no means so great as that which the English about this time felt from the *South-sea scheme*, which commenced in the year 1721. To explain this as concisely as possible, it must be observed, that ever since the revolution under king *William*, the government not having sufficient supplies granted by parliament, or what was granted requiring time to be collected, they were obliged to borrow money from several different companies of merchants; and among the rest from that company which traded to the South-sea. In the year 1716, the government was indebted to this company about

394
Directors
ruined.

After a few months, however, the people waked from their dream of riches; and found that all the advantages they expected were merely imaginary, while thousands of families were involved in one common ruin. Many of the directors, by whose arts the people were taught to expect such benefits from a traffic to the South-sea, had amassed considerable fortunes by the credulity of the public. It was some consolation, however, to the people to find the parliament sharing in the general indignation, and resolving to stop those

usurp.

394
South-sea
scheme.

Britain.

unjust plunderers of their possessions. Orders were first given to remove all the directors of the South-sea company from their seats in parliament, and the places they possessed under government. The principal delinquents were punished by a forfeiture of all such possessions and estates as they had acquired during the continuance of this popular frenzy. The next care was to redress the sufferers. Several just and useful resolutions were taken by parliament, and a bill was speedily prepared for repairing the late sufferings as far as the inspection of the legislature could extend. Of the profit arising from the South-sea scheme, the sum of seven millions were given back to the original proprietors; several additions were also made to their dividends out of what was possessed by the company in their own right; and the remaining capital stock was also divided among the old proprietors at the rate of 33 per cent.—In the mean time, petitions from all parts of the kingdom were presented to the house demanding justice; and the whole nation seemed exasperated to the highest degree. Public credit sustained a terrible shock. Some principal members of the ministry were deeply concerned in these fraudulent transactions. The bank was drawn upon faster than it could supply; and nothing was heard but the ravings of disappointment, and the cries of despair.

396
Unsuccessful expedition of admiral Hosier.

By degrees, however, the effects of this terrible calamity wore off, and matters returned to their former tranquillity. A new war with Spain commenced. Admiral Hosier was sent to South America to intercept the Spanish galleons; but the Spaniards, being apprized of his design, relanded their treasure. The greatest part of the British fleet sent on that expedition was rendered entirely unfit for service. The seamen were cut off in great numbers by the malignity of the climate and the length of the voyage, while the admiral himself is said to have died of a broken heart. In order to retaliate these hostilities, the Spaniards undertook the siege of Gibraltar; but with as little success on their side. In this dispute France offered her mediation; and such a reconciliation as treaties could procure was the consequence: a temporary peace ensued; both sides only watching an opportunity to renew hostilities with advantage.

397
Death of King George I.

Soon after the breaking up of the parliament in the year 1727, the king resolved to visit his electoral dominions of Hanover. Having appointed a regency in his absence, he embarked for Holland, and lay, upon his landing, at a little town called *Voot*. Next day he proceeded on his journey; and in two days more, between ten and eleven at night, arrived at Delden, to all appearance in perfect health. He supped there very heartily, and continued his journey early the next morning; but between eight and nine ordered his coach to stop. It being perceived that one of his hands lay motionless, monsieur Fabrice, who had formerly been servant to the king of Sweden, and who now attended king George, attempted to quicken the circulation, by chafing it between his own. As this had no effect, the surgeon who followed on horseback was called, and he rubbed it with spirits. Soon after, the king's tongue began to swell, and he had just strength enough to bid them hasten to Osnaburgh. Then, falling insensible into Fabrice's arms, he never recovered; but expired about 11 o'clock the next morning, in the 68th year

Britain.

of his age, and 13th of his reign. His body was conveyed to Hanover, and interred among his ancestors.

398
George II. succeeds.
399
Contentions between the court and country parties.

On the accession of George II. the two great parties into which the nation had so long been divided, again changed their names, and were now called the *court* and *country* parties. Throughout the greatest part of this reign, there seem to have been too objects of controversy, which rose up in debate at every session, and tried the strength of the opponents; these were the national debt, and the number of forces to be kept in pay. The government on the present king's accession owed more than 30,000,000 of money; and tho' there was a long continuance of profound peace, yet this sum was found constantly increasing. It was much wondered at by the country party how this could happen, and it was as constantly the business of the court to give plausible reasons for the increase. Thus, demands for new supplies were made every session of parliament, either for the purposes of securing friends upon the continent, or guarding the kingdom from internal conspiracies, or of enabling the ministry to act vigorously in conjunction with the powers in alliance abroad. It was vainly alleged that those expences were incurred without preference or necessity; and that the increase of the national debt, by multiplying and increasing taxes, would at last become an intolerable burden to the poor. These arguments were offered, canvassed, and rejected; the court party was constantly victorious, and every demand was granted with cheerfulness and profusion.

400
Account of the charitable corporation.

The next thing worthy of notice in the reign of George II. is the *charitable corporation*. A society of men had united themselves into a company by this name; and their professed intention was to lend money at legal interest to the poor upon small pledges, and to persons of higher rank upon proper security. Their capital was at first limited to L. 30,000, but they afterwards increased it to L. 600,000. This money was supplied by subscription, and the care of conducting the capital was intrusted to a proper number of directors. This company having continued for more than 20 years, the cashier, George Robinson, member for Marlow, and the warehouse-keeper, John Thomson, disappeared in one day. Five hundred thousand pounds of capital were found to be sunk or embezzled by means which the proprietors could not discover. They therefore, in a petition, represented to the house the manner in which they had been defrauded, and the distress to which many of the petitioners were reduced. A secret committee being appointed to examine into this grievance, a most iniquitous scene of fraud was soon discovered, which had been carried on by Thomson and Robinson, in concert with some of the directors, for embezzling the capital and cheating the proprietors. Many persons of rank and quality were concerned in this infamous conspiracy; and even some of the first characters in the nation did not escape censure. No less than six members of parliament were expelled for the most fordid acts of knavery. Sir Robert Sutton, Sir Archibald Grant, and George Robinson, for their frauds in the management of the charitable corporation scheme; Dennis Boad, and serjeant Burch, for a fraudulent sale of the late unfortunate earl of Derwentwater's estate; and lastly, John Ward, of Hackney, for forgery. It was at this time asserted in the house of Lords, that not one shilling of the forfeited estates was ever applied to the

Britain. the service of the public, but became the reward of fraudulence and venality.

401
cific
reme
led.

This happened in the year 1731; and in 1732, a scheme was formed by Sir Robert Walpole of fixing a general excise. He introduced it by recouring the frauds practised by the factors in London that were employed in selling the American tobacco. To prevent these frauds, he proposed, that instead of having the customs levied in the usual manner upon tobacco, all hereafter to be imported should be lodged in warehouses appointed for that purpose by the officers of the crown; and should from thence be sold, upon paying the duty of 4d. per pound, when the proprietor found a purchaser. This proposal raised a violent ferment, both within doors and without. At last, the fury of the people was worked up to such a pitch, that the parliament-house was surrounded by multitudes, who intimidated the ministry, and compelled them to drop the design. The miscarriage of the bill was celebrated with public rejoicings in London and Westminster, and the minister was burned in effigy by the populace at London.

402
rliament
olved.

On this occasion an attempt was made to repeal the septennial bill, and bring back triennial parliaments, as settled at the Revolution. But notwithstanding the warmth of the opposition, the ministry, exerting all their strength, were victorious, and the motion was suppressed by the majority. However, as on this occasion the country party seemed to have gained strength, it was thought proper to dissolve the parliament; and another was called by the same proclamation.

403
or with
ain.

The same disputes were carried on in this parliament as in the former. New subjects of controversy offered every day, and both sides were eager to seize them. A convention agreed on by the ministry, at the Prado, with Spain, became an object of warm altercation. By this the court of Spain agreed to pay 95,000*l.* to the English, as a satisfaction for all demands; and to discharge the whole in four months from the day of ratification. This, however, was considered as not equivalent to the damages that had been sustained, which were said to amount to 340,000*l.* On this occasion the minister was provoked into unusual vehemence, and branded the opposite party with the appellation of traitors. The ministry, as usual, were victorious; and the country party finding themselves out-numbered and out-voted in every debate, resolved to withdraw for ever: Walpole, being thus left without opposition, took the opportunity of passing several useful laws in their absence, in order to render the opposite party odious or contemptible.

404
tto Bello
ca.

In 1739, a new war commenced with Spain. Ever since the treaty of Utrecht, the Spaniards in America had insulted and distressed the commerce of Great Britain; and the British merchants had endeavoured to carry on an illicit trade in their dominions. As a right of cutting logwood in the bay of Campechy, claimed by the British, gave them frequent opportunities of pushing in contraband commodities upon the continent, the Spaniards resolved to put a stop to the evil by refusing liberty to cut logwood in that place. The Spanish guarda-costas continued their levities upon the British, and many British subjects were sent to dig in the mines of Potosi. One remonstrance followed another to the court of Madrid; but the only an-

swers given were promises of inquiry, which produced no reformation. In 1739, war was declared with all proper solemnity; and soon after, admiral Vernon, with six ships only, destroyed all the fortifications of Porto Bello, and came away victorious, with scarce the loss of a man.

As the war was thus successfully begun, supplies were cheerfully granted to prosecute it with all imaginable vigour. Commodore Anson was sent with a squadron of ships to disturb the enemy in the South seas, and to co-operate occasionally with admiral Vernon across the isthmus of Darien. This squadron was designed to act a subordinate part to a formidable armament that was to be sent against New Spain; but through the mismanagement of the ministry both these schemes were frustrated. Anson was detained till too late in the season; he then set out with five ships of the line, a frigate, and two store-ships, with about 1400 men. Coming into the stormy South seas at a very wrong season of the year, he encountered the most terrible storms; his fleet was dispersed, and his crew deplorably afflicted with the fevry; so that with much difficulty he gained the delightful island of Juan Fernandez. Here he was joined by one ship and a frigate of seven guns. From thence sailing along the coast of Chili, he plundered and burnt the town of Païta. He next traversed the great Pacific ocean, in hopes of meeting with one of the immensely rich galleons that trade from the Philippine islands to Mexico. Having refreshed his men at the island of Tinian, he set forward for China; and returning the same way he came, at last discovered the galleon. Her he engaged, and took; and with this prize, valued at 313,000*l.* together with other captures to the value of about as much more, he returned home after a voyage of three years. By this expedition the public sustained the loss of a fine squadron of ships, but a few individuals became possessed of immense fortunes.

405
Utrecht
and attempt
of Carthage-
na.

The other expedition ended still more unfortunately. The armament consisted of 29 ships of the line, and almost an equal number of frigates, furnished with all kinds of warlike stores, near 15,000 seamen, and as many land forces. The most sanguine hopes of success were entertained; but the ministry detained the fleet without any visible reason, till the season for action in America was almost over. At last, however, they arrived before the wealthy city of Carthagen. They soon became masters of the strong forts which defended the harbour. But though by this means they advanced a good deal nearer the town, they found great difficulties still before them. It was asserted, that the fleet could not be near enough to batter the town; and therefore the remaining forts must be attempted by assault. This dangerous experiment was tried; the galleys were slain by the enemy's fire, and then the forces mislaid their way. Instead of attempting the weakest place of the fort, they attacked the strongest, and where they were exposed to the fire of the whole town. Their scaling ladders were too short; and, at last, after bearing a dreadful fire with great resolution for some hours, they retreated, leaving 600 men dead on the spot. The winters of the climate now began to be more dreadful than those of war. The rainy season commenced with such violence, that it was impossible for the troops to continue their encampment. To these calamities were

added.

⁴²⁷ Britain. added the diffension between the sea and land commanders, who blamed each other, and at last could be only brought to agree in one mortifying measure, *viz.* to re-embark the troops, and withdraw them as quick as possible.

⁴²⁷ Resignation of Sir Robert Walpole. The miscarriage of this enterprize produced the greatest discontents; especially as other causes of complaint were now joined with it. Sir John Norris had twice failed to the coast of Spain at the head of a very powerful squadron, without doing any thing to the purpose. The commerce of Britain was greatly annoyed by the Spanish privateers, who had taken 407 ships since the commencement of the war; while the British fleets seemed to be quite inactive, and to suffer one loss after another, without endeavouring in the least to make proper reprisals. These discontents burst all at once upon Sir Robert Walpole; a majority in the house of commons was formed against him; he was created earl of Orford, the parliament being adjourned for a few days for that purpose; and he resigned all his employments.

The removal of this minister gave universal satisfaction. His antagonists entertained great hopes of seeing him punished: but he had laid his schemes too well to be under any apprehensions on that account; and what was worse, the new ministry were no sooner got in, than they trod in the footsteps of those they had so much exclaimed against. The nation had now become disgusted with naval operations. The people wished for a renewal of their victories in Flanders, and the king ardently joined in the same wish. An army of 16,000 men was therefore shipped over into Flanders, to take part in the quarrels that were then beginning on the continent. Immense triumphs were expected from this undertaking; but they forgot that the army was not now commanded by the duke of Marlborough.

⁴²⁸ An army sent into Flanders.

⁴²⁹ Origin of the continental war.

In order to give some notion of the origin of these continental quarrels, it is necessary to go back for some years. After the duke of Orleans, who had been regent of France, died, cardinal Fleury undertook to settle the confusion in which the kingdom was then involved. Under him France repaired her losses, and enriched herself by commerce. During the long interval of peace which this minister's councils had procured for Europe, two powers, till now unregarded, began to attract the notice and jealousy of the neighbouring nations. These were Russia and Prussia. The other states were but little prepared to renew war. The empire remained under the government of Charles VI. who had been placed on the throne by the treaty of Utrecht. Sweden continued to languish from the destructive projects of Charles XII. Denmark was powerful enough, but inclined to peace; and part of Italy still remained subject to those princes who had been imposed upon it by foreign treaties.

All these states, however, continued to enjoy a profound peace, until the death of Augustus king of Poland, by which a general flame was once more kindled in Europe. The emperor, assisted by the arms of Russia, declared for the elector of Saxony, son to the deceased king. On the other hand, France declared for Stanislaus, who had long since been nominated king of the Poles by Charles of Sweden, and whose daughter the king of France had since married. Stanislaus was gladly received at Dantzic, and acknowledged king of

Poland; but here he was besieged by 10,000 Russians, the city taken, and he himself with difficulty made his escape. France, however, still resolved to assist him, as this, it was thought, would be the most effectual method of distressing the house of Austria. These views of France were seconded by Spain and Sardinia, both of which hoped to grow rich by the spoils of Austria. A French army, therefore, over-ran the empire, under the conduct of the old marshal Villars; while the duke of Montemar, the Spanish general, was equally victorious in the kingdom of Naples. The emperor was soon obliged to sue for peace; which was granted, but Stanislaus was neglected in the treaty. It was stipulated that he should renounce all claim to the kingdom of Poland; for which the emperor gratified France with the duchy of Lorraine, and some other valuable territories.

The emperor dying in the year 1740, the French began to think this a favourable opportunity for exerting their ambition. Regardless of treaties, therefore, particularly that called the *Pragmatic Sanction*, by which the late emperor's dominions were settled upon his daughter, they caused the elector of Bavaria to be crowned emperor. Thus the queen of Hungary, daughter of Charles VI. was at once stripped of her inheritance, and was left for a whole year deserted by all Europe, and without any hopes of succour. At the same time she lost the province of Silesia by an irruption of the young king of Prussia, who took the opportunity of her defenceless state to renew his pretensions to that province, of which his ancestors had been unjustly deprived. France, Saxony, and Bavaria, attacked the rest of her dominions: Britain was the only ally that seemed willing to assist her; in which, however, Sardinia, Holland, and Russia, soon after concurred.

⁴¹⁰ Desperate situation of the queen of Hungary.

It must be owned that Britain had no other reason for interfering in these disputes, than that the security of the electorate depended upon nicely balancing the different interests of the empire; and the ministry were willing to gratify the king. His majesty informed the parliament, that he had sent a body of British forces into the Netherlands, which he had augmented by 16,000 Hanoverians, to make a diversion upon the dominions of France, in favour of the queen of Hungary. When the supplies came to be considered by which this additional number of Hanoverian troops was to receive pay from Britain for defending their own cause, most violent parliamentary debates ensued; but the ministry carried their point by the strength of numbers.

But, however prejudicial these continental measures might be to the true interests of Great Britain, they effectually retrieved the queen of Hungary's desperate affairs, and soon began to turn the scale of victory on her side. The French were driven out of Bohemia. Her general, prince Charles, at the head of a large army, invaded the dominions of Bavaria. Her rival, the nominal emperor, was obliged to fly before her; and being abandoned by his allies, and stripped even of his hereditary dominions, retired to Frankfort, where he lived in obscurity.

⁴¹¹ Relieved by the British forces.

In the mean time, the British and Hanoverian army advanced, in order to effect a junction with that of prince Charles of Lorrain, in which case they would have outnumbered their enemies. To prevent this, the French opposed an army of 60,000 men, under the command of the marshal de Noailles, who posted his troops on the

⁴¹² Battle of Dettingen.

Britain.

Britain.

the east side of that river. The British army was commanded by the earl of Stair, who had learned the art of war under the great prince Eugene; nevertheless, he suffered himself to be inclosed by the enemy on every side, near a village called *Dettingen*. In this situation, the whole army, with the king himself, who had by this time arrived in the camp, must have been taken, had the French behaved with prudence. Their impetuosity, however, saved the whole army. They passed a defile, which they ought to have contented themselves with guarding; and, under the conduct of the duke of Gramont, their horse charged the British foot with great fury. They were received with great resolution; and at last obliged to repass the Mayne with precipitation, and the loss of about 5000 men.

India ships, and a Spanish ship from Peru laden with treasure, put into the harbour, supposing it still their own, and were taken.

416

During this gleam of returning success, Charles Edward, the son of the old pretender to the British crown, resolved to make an attempt to recover what he called his right. Being furnished with some money from France, he embarked for Scotland aboard a small frigate, accompanied by the marquis of Tullibardine, Sir Thomas Sheridan, and some others; and for the conquest of the whole British empire only brought with them seven officers, and arms for 2000 men.

417

Fortune, however, seemed no way more favourable to this attempt than to others similar to it. His convoy, a ship of 60 guns, was so disabled in an engagement with an English man of war, that it was obliged to return to Brest, while he continued his course to the western parts of Scotland. On the 27th of July 1745, he landed on the coast of Lochaber, and was in a little time joined by the highlanders, to the number of 1500: the ministry at first could scarcely be induced to credit his arrival; but when they could no longer doubt of it, they sent Sir John Cope with a small body of forces to oppose his progress.

418

By this time the young adventurer was arrived at Perth, where he performed the ceremony of proclaiming his father king of Great Britain. From thence, descending towards Edinburgh, and his forces continually increasing, he entered the capital without opposition; but was unable, for want of cannon, to reduce the castle. Here he again proclaimed his father; and promised to dissolve the union, which was considered as one of the national grievances. In the mean time, Sir John Cope, being reinforced by two regiments of dragoons, resolved to give the enemy battle. The rebels attacked him near Prestonpans, and in a few minutes put him and his troops to flight, with the loss of 500 men.

419

This victory gave the rebels great influence; and had the pretender marched directly to England, the consequence might have been fatal to freedom. But he was amuted by the promise of succours which never came; and thus induced to remain in Edinburgh till the season for action was lost. He was joined, however, by the earl of Kilmarnock, lord Balmerino, lord Cromarty, Elcho, Ogilvy, Pitligo, and the eldest son of lord Lovat, who with their vassals considerably increased his army. Lord Lovat himself, so remarkable for his treachery, was an enthusiast in favour of the pretender, but was unwilling to act openly for fear of the ministry. But while Charles was thus trifling away his time at Edinburgh, the British ministry were taking effectual methods to oppose him. Six thousand Dutch troops, that had come over to the assistance of the crown, were dispatched northward under the command of general Wade; but, as it was then said, they could lend no assistance, being prisoners of France upon their parole, and under engagements not to oppose that power for a year. But however this be, the duke of Cumberland soon after arrived from Flanders, and was followed by another detachment of dragoons and infantry, well disciplined and trained to action; and besides these, volunteers offered themselves in every part of the kingdom.

420

At last, Charles resolved upon an irruption into

421

413
intended
invasion
of Britain
by the
French.

Though the British were victorious in this engagement, the French were very little disconcerted by it. They opposed prince Charles, and interrupted his attempts to pass the Rhine. In Italy they also gained some advantages; but their chief hopes were placed on an intended invasion of England. From the violence of parliamentary disputes in England, France had been persuaded that the country was ripe for a revolution, and only wanted the presence of the pretender to bring about a change. An invasion was therefore actually projected. The troops destined for the expedition amounted to 15,000; and preparations were made for embarking them at Dunkirk, and some of the ports nearest to England, under the eye of the young pretender. The duke de Roquesville, with 20 ships of the line, was to see them safely landed on the opposite shore, and the famous count Saxe was to command them when landed. But the whole project was disconcerted by the appearance of Sir John Norris, who with a superior fleet made up to attack them. The French fleet was obliged to put back; a very hard gale of wind damaged their transports beyond redress; and the French, now frustrated in their scheme of a sudden descent, thought fit openly to declare war.

The national joy for Sir John Norris's success, however, was soon damped by the miscarriage of admirals Matthews and Lestock; who, thro' a misunderstanding between themselves, suffered a French fleet of 34 sail to escape them near Toulon. In the Netherlands the British arms were attended with still worse success. The French had there assembled an army of 120,000 men, commanded by count Saxe, natural son to the late king of Poland, an officer of great experience. The English were headed by the duke of Cumberland, who had an inferior army, and was much inferior in the knowledge of war to the French general. Count Saxe, therefore, carried all before him. In 1743, he besieged Fribourg; and in the beginning of the campaign 1744, invested the strong city of Tournay. To save this place, if possible, the allies resolved to hazard an engagement; and on this ensued the bloody battle of Fontenoy, in which the allies left on the field of battle near 12,000 men, and the French almost an equal number. In consequence of this victory, Tournay was soon after taken by the French. To balance the bad success, however, admirals Rowley and Warren had retrieved the honour of the British flag, and made several rich captures at sea. The forts of Louiburg, a place of great consequence to the British commerce, surrendered to general Pepperell; while, a short time after, two French East-

taken.

^{Britain.} England. He entered that country by the western border, and took the town of Carlisle; after which he continued his march southwards, having received assurances that a considerable body of forces would be landed on the northern coasts to make a diversion in his favour. He established his head-quarters at Manchester, where he was joined by about 200 English formed into a regiment, under the command of colonel Townley. From thence he pursued his march to Derby, intending to go by the way of Chester into Wales, where he hoped to be joined by a great number of malecontents; but in this he was prevented by the factions among his followers.

⁴¹⁸ ^{Great con-} Being now advanced within 100 miles of London, that capital was in the utmost consternation: and had he proceeded with the same expedition he had hitherto used, perhaps he might have made himself master of it. But he was rendered incapable of pursuing this, or any other rational plan, by the discontents which began to prevail in his army. In fact, the young pretender was but the nominal leader of his forces; his generals, the Highland chiefs, being averse to subordination, and ignorant of command. They were now unanimous in their resolution to return to their own country, and Charles was forced to comply. They retreated to Carlisle without any loss; and from thence crossing the rivers Eden and Solway, entered Scotland. They next marched to Glasgow, which was laid under severe contributions. From thence advancing to Stirling, they were joined by lord Lewis Gordon at the head of some forces which had been assembled in his absence. Other clans likewise came in; and from some supplies of money received from Spain, and some skirmishes with the royalists, in which he was victorious, the pretender's affairs began to wear a more promising aspect. Being joined by lord Drummond, he invested the castle of Stirling, in the siege of which much time was consumed to no purpose. General Hawley, who commanded a considerable body of forces near Edinburgh, undertook to raise this siege, and advanced towards the rebel army as far as Falkirk. After two days spent in mutually examining each others strength, an engagement ensued, in which the king's forces were entirely defeated, with the loss of their tents and artillery.

⁴¹⁹ ^{Great con-} This was the end of all the triumphs of the rebel army. The duke of Cumberland having arrived, was put at the head of the troops at Edinburgh, which amounted to about 12,000 men. With these he advanced to Aberdeen, where he was joined by several of the nobility attached to the house of Hanover; the enemy in the mean time retreating before him. He next advanced to the banks of the Spey, a deep and rapid river, where the rebels might have disputed his passage; but their contentions with one another were now risen to such a height, that they could scarce agree in any thing. At last they resolved to wait their pursuers. An engagement ensued at Culloden*, near Inverness; in which the rebels were defeated with great slaughter, and a final period was put to all the hopes of the young adventurer. The conquerors behaved with the greatest cruelty; refusing quarter to the wounded, the unarmed, and the defenceless; some were slain who had only been spectators of the combat, and soldiers were seen to anticipate the base employment of the executioner. The duke, immediately after the action, ordered 36 deserters to be executed: the conquerors spread terror wherever they came; and after a short space, the whole country round was one dreadful scene of plunder, slaughter, and desolation.

⁴²⁰ ^{Rebels re-} Immediately after the engagement, the young pretender fled away with a captain of Fitzjames's cavalry; and when their horses were fatigued, they both alighted, and separately sought for safety. There is a striking resemblance between the adventures of Charles II. after the battle of Worcester, and those of the young pretender after the battle of Culloden. For some days he wandered in the country. Sometimes he found refuge in caves and cottages, without any attendants at all. Sometimes he lay in forests with one or two companions of his distress, continually pursued by the troops of the conqueror, there being a reward of 30,000*l.* offered for taking him either dead or alive. In the course of his adventures, he had occasion to trust his life to the fidelity of above 50 individuals; not one of whom could be prevailed upon by so great a reward as was offered, to betray him whom they looked upon to be their king's son.

⁴²¹ ^{Gain the} For six months the unfortunate Charles continued to wander in the frightful wilds of Glengary, often hemmed round by his pursuers, but still rescued by some providential accident from the impending danger. At length, a privateer of St Maloes, hired by his adherents, arrived in Lochranach, in which he embarked in the most wretched attire. He was clad in a short coat of black frize, thread-bare; over which was a common Highland plaid, girt round him by a belt, from which hung a pistol and dagger. He had not been shifted for many weeks; his eyes were hollow, his visage wan, and his constitution greatly impaired by famine and fatigue. He was accompanied by Sullivan and Sheridan, two Irish adherents who had shared all his calamities; together with Cameron of Lochiel, his brother, and a few other exiles. They set sail for France; and, after having been chased by two English men of war, arrived in safety at a place called *Roseau* near Morlaix in Bretagne.

^{Britain.} He escaped being chased by two English men of war, arrived in safety at a place called *Roseau* near Morlaix in Bretagne.

⁴²² ^{Entirely de-} While the pretender was thus pursued, the scaffolds and gibbets were preparing for his adherents. Seventeen officers were hanged, drawn, and quartered, at Kennington-common in the neighbourhood of London; nine were executed in the same manner at Carlisle, and eleven at York. A few obtained pardons, and a considerable number of the common men were transported to America. The earls of Kilmarnock and Cromarty, and lord Balmerino, were tried and found guilty of high treason. Cromarty was pardoned: but Kilmarnock and Balmerino were executed; as was also Mr Radcliffe brother to the late earl of Derwentwater, who was sentenced upon a former conviction. Lord Lovat was tried, and suffered some time after.

⁴²³ ^{Adven-} Immediately after the suppression of the rebellion, the legislature undertook to establish several regulations in Scotland, which were equally conducive to the happiness of the people and the tranquillity of the united kingdoms. The Highlanders had till that time continued to wear the military dress of their ancestors, and never went without arms. In consequence of this, they considered themselves as a body of people distinct from the rest of the nation, and were ready, upon the shortest notice,

Britain. notice, to second the insurrections of their chiefs. Their habits were now reformed by an act of legislature, and they were compelled to wear clothes of the common fashion. But what contributed still more to their real felicity was the abolition of that hereditary jurisdiction which their chieftains exerted over them. The power of their chieftains was totally destroyed, and every subject in that part of the kingdom was granted a participation in the common liberty.

Soon after the battle of Culloden, the duke of Cumberland returned to Flanders, where he resumed the command of an army to which he was by no means equal. The French carried every thing before them; and they reduced under their dominion all those strong towns which had been taken by the duke of Marlborough, and formed a barrier to the United Provinces. They gained a considerable victory at Roueroux; which, however, cost them as many men as they destroyed of the enemy; but these they could more easily spare, as they were much more numerous. Another victory which they obtained at La Feldt, served to depress the allied army still lower. But the taking of Bergen-op-zoom, the strongest fortification of Brabant, reduced the Dutch to a state of desperation.

These victories and successes in Flanders were, however, counterbalanced by almost equal disappointments. In Italy, the marshal Belleisle's brother, attempting to penetrate, at the head of 34,000 men, into Piedmont, was defeated and killed. A fleet was fitted out for the recovery of Cape Breton, but without success. Two others were fitted out, the one to make a descent upon the British colonies in America, and the other to carry on the operations in the East Indies; but these were attacked by Anson and Warren, and nine of their ships taken. Soon after this, commodore Fox, with six ships of war, took above 40 French ships richly laden, from St Domingo; and soon after this the French fleet was defeated by admiral Hawke, who took seven ships of the line and several frigates.

For a long time Louis had been desirous of a general tranquillity; and this desire he had even expressed to Sir John Ligonier, who was taken prisoner at the battle of La Feldt. But now the bad success of his admirals at sea, his armies in Italy, the frequent bankruptcies of his merchants at home, and the election of a stadtholder in Holland who gave spirit to the opposition; all these contributed to make him weary of the war, and to propose terms of accommodation. This was what the allies had long wished for, but had been ashamed to demand. A congress, therefore, was held at Aix-la-Chapelle, where a treaty was concluded on the following terms. 1. That all prisoners on each side should be mutually given up, and all conquests restored. 2. That the duchies of Parma, Placentia, and Guastalla, should be ceded to Don Philip, heir apparent to the Spanish crown; after whom these dominions should return to the house of Austria. 3. That the fortifications of Dunkirk towards the sea should be demolished; and that the British ship annually sent with slaves to the coast of New Spain, should have this privilege continued for four years. 4. That the king of Prussia should be confirmed in the possession of Silesia, and that the queen of Hungary should be secured in the possession of her patrimonial dominions. But the most remarkable clause was, that the king of Great Britain should immediately,

after the ratification of this treaty, send two persons of rank to France as hostages, until restitution should be made of Cape Breton and all other British conquests made during the war. No mention was made of the searching British vessels in the American seas, though this was the original cause of the quarrel. The limits of their respective possessions in North America were not ascertained; nor did they receive any equivalent for those forts which they restored to the enemy.

In the year 1751, died Frederic prince of Wales, of a pleurisy thought at first to be no way dangerous. He was greatly regretted; for his good-nature had rendered him popular, and those who opposed the present administration had grounded all their hopes of redress upon his accession to the throne.

Some time before this, viz. in the year 1749, a scheme was entered upon, which the nation in general imagined would be very advantageous. This was the encouraging those who had been discharged the army or navy to become settlers in Nova Scotia. This country is cold, barren, and almost incapable of cultivation. Nevertheless, on account of this barren spot, the English and French renewed the war, which soon after spread with such terrible devastation over every part of the globe. The possession of this country was reckoned necessary to defend the English colonies to the north, and to preserve their superiority in the fisheries in that part of the world. The French, however, who had been long settled in the back parts, resolved to use every method to dispossess the new comers, and spirited up the Indians to begin hostilities. Another source of dispute also sprung up soon after in the same part of the world. The French, pretending to have first discovered the mouth of the river Mississippi, claimed the whole adjacent country towards New Mexico on the east, quite to the Apalachian mountains on the west. In order to assert their claims, as they found several English who had settled beyond these mountains, they dispossessed them of their new settlements, and built such forts as would command the whole country round about.

Negotiations, mutual accusations, and hostilities, first took place between the two powers; at length, in 1756, four operations were undertaken by the British in America at once. Colonel Monkton had orders to drive the French from their encroachments upon the province of Nova Scotia. General Johnston was sent against Crown Point; General Shirley against Niagara, to secure the forts on the river; and General Braddock against Fort du Quesne. In these expeditions, Monkton was successful; Johnston also was victorious, though he failed in taking the fort against which he was sent; Shirley was thought to have lost the reason or operation by delay; and Braddock was defeated and killed.

In return for this bad success, the British made reprisals at sea; and in this they were so successful, that the French navy was unable to recover itself during the continuance of the war that was shortly after declared on both sides. The first step of the French was to threaten an invasion. Several bodies of their troops were sent down to the coasts that lay opposite to the British shore; these were instructed in the manner of embarking and relanding from flat-bottomed boats, which were made in great numbers for that expedition.

Death of the Prince of Wales.

431
The English and French renewed the war.

Britain. The number of men amounted to 50,000: but all discovered the utmost reluctance to the undertaking. The ministry were greatly alarmed. They applied to the Dutch for 6000 men, which they were by treaty obliged to furnish in case of an invasion. This supply was refused; the Dutch alleging, that their treaty was to send the troops in case of an actual, and not a threatened, invasion. The king, therefore, finding he could not have the Dutch forces till their assistance would be too late, desisted entirely from his demand; and the Dutch with great animity returned him thanks for withdrawing his request. Upon this, 10,000 Hessians and Hanoverians were brought over. But this occasioned great discontent. The ministry were reviled for such disgraceful condescension, as if the nation was unable to defend itself. The people only demanded a vigorous exertion of their own internal strength, and then feared no force that could be led to invade them.

432
Minorca
invaded.

The British invasion, however, never took place: but a French army landed in Minorca, and invested the citadel of St Philip's, which was reckoned the strongest in Europe; but the garrison was weak, and no way fitted to stand a vigorous siege. To raise this siege, admiral Byng was dispatched with a squadron of ten men of war, with orders to relieve Minorca, or at any rate to throw a body of troops into the garrison. This last he reckoned too hazardous an undertaking; nor did he even attempt it. Soon after, a French fleet appeared nearly equal in force to his own; but the admiral resolved to act only upon the defensive. The French advanced; a slight engagement ensued with part of the English fleet; after which, the French slowly sailed away, and another opportunity never occurred of coming to a closer engagement. After this, it was resolved in a council of war to return to Gibraltar to resist, and that the relief of Minorca was impracticable. For this conduct Byng was brought home under arrest, tried, and sentenced to death. His sentence was to be shot; and he suffered with the greatest resolution, after delivering a paper filled with protestations of his innocence as to any treacherous intention.

434
Treaty with
Russia.

After the conquest of Minorca, the French declared that they would revenge all injuries they should sustain in their colonies on the king of Britain's dominions in Germany. Upon this, the court of London, eager to preserve Hanover, entered into a treaty with the court of Russia, by which it was stipulated, that a body of 50,000 Russians should be ready to act in the British service, in case Hanover should be invaded by the French. For this the czarina was to receive 100,000l. annually, to be paid in advance. This treaty was opposed by the king of Prussia. He had long considered himself as guardian of the interests of Germany, and was therefore alarmed at a treaty which threatened to deluge the empire with an army of barbarians. Besides, he was already apprized of an agreement between the Austrians and Russians, by which the latter were to enter the empire and strip him of his late conquest of Silesia. He therefore declared, that he would not suffer any foreign forces to enter the empire, either as auxiliaries or principals. The king of Britain now found himself obliged to drop his Russian connection, and conclude a treaty with the king of Prussia. As both monarchs wished only to prevent the invasion of

435
Opposed by
the king of
Prussia.

Germany, they soon came to an agreement to assist each other mutually. From this alliance a new combination took place among the European powers, quite opposite to the former; and their forces were drawn out in the following manner. Britain opposed France in America, Asia, and on the ocean. France attacked Hanover; which the king of Prussia undertook to protect, while Britain promised him troops and money to assist his operations. Austria had their aims on the dominions of Prussia, and drew the elector of Saxony into the same designs. In these views the Austrians were seconded by France, Sweden, and Russia, who had hopes of acquiring a settlement in the west of Europe.

Britain.
436
New combination of
the European
powers.

Thus the king of Prussia lanced into the tumult of war, having only the king of Britain for his ally, while the most potent states of Europe were his antagonists. He now performed exploits perhaps unequalled in the annals of modern ages; for a particular account of which, see the article PRUSSIA. The British ministry, in order to procure a diversion in his favour, planned an enterprize against the coast of France. The destination of the fleet equipped for this purpose was kept a profound secret. At last it appeared before Rochford; where the commanders, having trifled away their time in deliberating how to proceed, secured the little island of Aix, an easy and an useless conquest: soon after which, they returned home, without attempting any thing else. By this miscarriage the ministry were so discouraged, that they had thoughts of abandoning the king of Prussia to his fate; and the king was actually meditating a negociation of this nature, when he was prevented by the expostulations of his distressed ally. From motives of generosity, therefore, more than of interest, it was resolved to continue to assist him; and success, which had long fled from the British arms, once more began to return with double splendour.

437
Unsuccessful
expedition
against
France.

It was in the East Indies where this returning success first began to appear (for an account of which see the article INDOSTAN); and their conquests in the western part of the world were about this time still more splendid than those in the east. But these successes must, partly at least, be ascribed to the vigorous administration of Mr William Pitt, who about this time came into power. An expedition was set on foot against Cape Breton, under general Amherst and admiral Boscawen; another, under general Abercrombie, against Crown Point and Ticonderago; and a third, under brigadier-general Forbes, against Fort du Quesne. The fortrefs of Louisburg, which defended the island of Cape Breton, was very strong both by nature and art; the garrison was numerous, the commander vigilant, and every precaution had been taken to prevent a landing. But the activity of the British surmounted every obstacle; the place was surrendered by capitulation, and its fortifications were demolished. The expedition against Fort du Quesne was equally successful; but that against Crown Point once more miscarried. General Abercrombie attacked the French in their entrenchments, was repulsed with great slaughter, and obliged to retire to his camp at Lake George. But though in this respect the British arms were unsuccessful, yet, upon the whole, the campaign of 1758 was greatly in their favour. The taking of Fort du Quesne

train. Quebec served to remove from their colonies the terror of the incursions of the Indians, while it interrupted the correspondence along a chain of forts with which the French had environed the British settlements in America, so that the succeeding campaign promised great success.

In 1759, it was resolved to attack the French in several parts of their empire at once. General Amherst with a body of 12,000 men was commanded to attack Crown Point; General Wolfe was to undertake the siege of Quebec; while general Prideaux and Sir William Johnson were to attempt a French fort near the cataracts of Niagara. This last expedition was the first that succeeded. The siege was begun with vigour, and promised an easy conquest; but general Prideaux was killed in the trenches by the bursting of a mortar, so that the whole command devolved on general Johnson. A body of French troops, sensible of the importance of the place, attempted to relieve it; but were utterly defeated and dispersed; soon after which, the garrison surrendered prisoners of war. On his arrival at the forts of Crown Point and Ticonderago, general Amherst found them deserted and destroyed. There now remained, therefore, but one decisive blow to reduce all North America under the British dominion; and this was by the taking of Quebec, the capital of Canada. This expedition was commanded by admiral Saunders and general Wolfe. The enterprize was attended with difficulties which appeared unsurmountable; but all these difficulties were got over by the conduct of general Wolfe, and the bravery of his men. He engaged and put to flight the French under Montcalm; but, to the great regret of the British, their general was killed in the action. The surrender of Quebec was the consequence of this victory, which was soon followed by the cession of all Canada. The following season, indeed, the French made a vigorous effort to recover the city; but by the resolution of governor Murray, and the appearance of a British fleet under the command of lord Colville, they were obliged to abandon the enterprize. The whole province was soon after reduced by the prudence and activity of general Amherst, who obliged the French army to capitulate, and it has since remained annexed to the British empire. About the same time also the island of Guadaloupe was reduced by commodore More and general Hopson.

The British affairs in Germany had at the beginning of the war worn a very unfavourable aspect. The Hanoverians were commanded by the duke of Cumberland, who was greatly outnumbered by the enemy. He was driven beyond the Weser, the passage of which might have been disputed with some appearance of success; but the French were suffered to pass it unmolested. The Hanoverians were driven from one part of the country to another, till at length they made a stand near a village called *Hastenback*, where it was hoped the numbers of the enemy would have the least opportunity of coming to a general engagement. The Hanoverians, however, left the field of battle to the French, after a faint resistance. Their enemies pursued, and the duke retired towards Stade; by which means he marched into a country from whence he could neither procure provisions, nor attack the enemy with any hopes of success. Here, being unable either to

escape or advance, he was compelled to sign a capitulation by which the whole army laid down their arms, and were dispersed into different quarters of confinement. By this remarkable capitulation, which was called the *capitulation of Cliver Seven*, Hanover was obliged to submit quietly to the French, who were now determined to turn their arms against the king of Prussia.

Soon after this capitulation, both sides began to complain that the treaty was not strictly observed. The Hanoverians exclaimed against the rapacity of the French general, and the brutality of his soldiers. The French retorted the charge against them; accused them of insolence and insurrection; and, being sensible of their own superiority, resolved to bind them strictly to their terms of agreement. The Hanoverians only wished for a pretence to take arms, and a general to lead them. Neither were long wanting. The oppressions of the tax-gatherers whom the French had appointed, were considered as so severe, that the army rose to vindicate the freedom of their country, while Ferdinand, prince of Brunswick, put himself at their head. As soon as this was known in Britain, large supplies were granted both for the service of the king of Prussia, and to enable the Hanoverian army to act vigorously in conjunction with him. A small body of British forces was sent over to join prince Ferdinand under the duke of Marlborough. After some inconsiderable successes at Crevelt, the duke of Marlborough dying, the command of the British forces devolved on lord George Sackville. A misunderstanding arose between him and prince Ferdinand, which appeared at the battle of Minden that was fought shortly after. Lord George pretended that he did not understand the orders sent him by the prince, and of consequence did not obey them. The allies gained the victory, which would have been more decisive had the British commander obeyed his orders. He was soon after recalled, tried by a court-martial, found guilty of disobedience, and declared incapable of serving in any military command for the future.

After this victory it was imagined, that one reinforcement more of British troops would terminate the war in favour of the allies; and that reinforcement was quickly sent. The British army in Germany was augmented to upwards of 30,000 men, and sanguine hopes of conquest were generally entertained. These hopes, however, were soon found to be ill founded. The allies were defeated at Corbach; but retrieved their honour at Exdail. A victory at Warbourgh followed shortly after, and another at Zierenberg; but then they suffered a defeat at Compen; after which, both sides retired into winter-quarters.

On the 25th of October 1760, happened the death of king George II. He had risen at his usual hour, and observed to his attendant, that as the weather was fine, he would take a walk into the gardens of Kensington, where he then resided. In a few minutes after his return, being left alone, he was heard to fall down upon the floor. The noise of this bringing his attendants into the room, they lifted him into bed; where he expired with a faint voice, that the prince of Ansbach might be sent for; but before he could reach the apartment, he expired, in the 77th year of his age, and 33d of his reign. An attempt was made to bleed

King George III. ascended the throne amidst the greatest successes both by sea and land. At this time, indeed, the efforts of Britain in every quarter of the globe were truly astonishing. The king of Prussia received a subsidy; a large body of English forces commanded the extensive peninsula of India; another army of 20,000 men confirmed their conquests in North America; 30,000 men were employed in Germany; and a great many more were dispersed in the different garrisons in different parts of the world: but all this was surpassed by the astonishing naval force, which carried command wherever it came, and had totally annihilated the French maritime power. The courage and conduct of the English admirals excelled everything that had been heard of before: neither superior force nor number, nor even the terrors of the tempest, could intimidate them. Admiral Hawke gained a complete victory over an equal number of French ships, in Quiberon bay on the coast of Bretagne, in the midst of a tempest, during the darkness of night, and, what a seaman fears still more, in the neighbourhood of a rocky shore.

As soon as his present majesty had met with his parliament, which was on November 18th 1760, he confirmed the hopes of his allies, and gave assurances of his intentions to prosecute the war with vigour. By this time, however, the people were in some measure weary with conquests; especially with those in Germany, from which they could never hope for any solid advantage, and which were gained at an immense expence to the nation. Disputes concerning the propriety of the German war were carried on, and the general run of popular opinion seemed to be rather against than for it. For some time, however, no change took place in the method of carrying on the war. In 1761, proposals of peace were made between the belligerent powers of Europe; and for this purpose Mr Stanley was sent to Paris, and Mr Bussy to London: but the French, designing to draw Spain into a confederacy with them, seem not to have been sincere in their intentions; and thus the treaty came to nothing. An enterprize was projected against the island of Belleisle, near the coast of France, which was conducted by commodore Keppel and general Hodgkin †. The place was conquered, with the loss of 1800 men killed and wounded on the part of the British; and however unimportant this conquest might be, the rejoicings on account of it were great. In Germany, the campaign was unsuccessful on the part of the allies. At last, indeed, they drove the French quite out of the territory of Hesse, and laid siege to the city of Cassel; but being defeated at Stangerode, they were forced to raise the siege, retire behind the Dymel, and again abandon Hesse to their enemies. Here they were followed and attacked by the French; who, tho' defeated in that attempt, were with difficulty prevented from making themselves masters of Munster and Brunsvick.

At this time an appearance of negotiation had been carried on; but at last the French having brought their designs with the court of Spain to a bearing, Mr

Bussy delivered to Mr Pitt a private memorial, signifying, that, in order to establish the peace on a lasting foundation, the king of Spain might be induced to guaranty the treaty; and to prevent the differences which then subsisted between Britain and Spain from producing a fresh war in Europe, he proposed, that in this negotiation, the three points which had been disputed between the crowns of England and Spain might be finally settled. First, the restitution of some captures made upon the Spanish flag. Secondly, the privilege of the Spanish nation to fish upon the banks of Newfoundland. Thirdly, the demolition of the English settlements made in the bay of Honduras. This memorial was returned as wholly inadmissible. Mr Pitt declared, that it would be looked upon as an affront to the dignity of his master, and incompatible with the sincerity of the negotiation, to make any further mention of such a circumstance.

Mr Pitt being now thoroughly convinced of the Spanish designs of Spain, proposed immediately to declare war against that kingdom. But this proposal being rejected, he resigned his employment of secretary of State; after which, he was created earl of Chatham, and had a pension of 3000*l.* per annum settled upon him for three lives.

Soon after this, however, the new administration found that Mr Pitt was in the right, and war was declared between Great Britain and Spain. As Portugal was an useful ally of Britain, it was resolved by the French and Spaniards to attack that kingdom, which was then in no capacity of defending itself. The Portuguese monarch was by the most haughty memorials commanded to accede to the confederacy against Britain, and threatened with the vengeance of France and Spain in case of a refusal. It was in vain that he promised to observe a strict neutrality, and urged the obligations he was under to the king of Britain; this moderate and reasonable reply only drew on more haughty and intulting answers. His Portuguese majesty, however, continued to reject their proposals in the most resolute manner; and concluded his last declaration with these words, that "it would affect him less, though reduced to the last extremity of which the great Judge is the sole arbiter, to let the last tile of his palace fall, and to see his faithful subjects spill the last drop of their blood, than to sacrifice, together with the honour of his crown, all that Portugal holds most dear; and to submit, by such extraordinary means, to become an unheard of example to all pacific powers, who will no longer be able to enjoy the benefit of neutrality, whenever a war shall be kindled between other powers with which the former are connected by defensive treaties." This declaration was made on the 27th of April 1762; and soon after, France and Spain jointly declared war against Portugal.

As the design of the courts of France and Spain in making war with Portugal, was professedly to prevent Great Britain from the military and commercial use of the ports of that kingdom, their principal endeavours were aimed at the two great ports where the British used to reside, *viz.* Oporto and Lisbon. With this view, three inroads were to be made; one to the north; another more to the south; while the third was made in the middle provinces, in order to sustain these two bodies, and preserve a communication between them.

The

tain. The first body of troops was commanded by the marquis of Savria; and entered the north east angle of Portugal, marching towards Miranda. This town might possibly have retarded their progress, had not a powder-magazine been blown up by accident; and the Spaniards entered on the 9th of May by the breach made by this explosion. From thence they marched to Braganza, which surrendered six days after Miranda. Moncorvo was taken in like manner; every thing was clear before them to the banks of the Douro; and they became masters of almost the whole extensive province of Tralos Montes. Oporto was given up for lost, and the admiralty prepared transports to carry off the effects of the British merchants. On the banks of the Douro, however, the career of this body was stopped. The peasants, animated, and guided by some British officers, seized a difficult pass, and drove the enemy back to Moncorvo.

The second body of Spaniards entered the province of Beira, at the villages called *Val de Mula* and *Val de Coelha*. They were joined by strong detachments amounting to almost the whole army in Tralos Montes; and immediately laid siege to Almeida, the strongest and best provided place on the frontiers of Portugal. This place was defended with sufficient resolution; but, like the rest, was obliged to surrender on the 25th of August. The Spaniards then over-ran the whole territory of Castell Branco, a principal district of the province of Beira, making their way southward until they approached the banks of the Tagus. During the whole of their progress, and indeed during the whole of the campaign, the allied troops of Great Britain and Portugal had nothing that could be called an army in the field, and they could not think of opposing the enemy in a pitched battle. All that could be done was by the defence of passes, skirmish, and surprise.

By this time the count of La Lippe Buckeburg had arrived in Portugal, to the inexpressible joy of the whole nation. The third Spanish army had assembled on the frontiers of Estremadura, with a design to invade the province of Alentejo; and had this body of troops been joined to the others, they would probably, in spite of all opposition, have forced their way to Lisbon itself; had it acted separately, it might have greatly distracted the defendants, so as to enable some other body of forces to penetrate to that city. The count, therefore, resolved to prevent their entrance into the kingdom; and with this view dispatched brigadier-general Burgoyne to attack an advanced body of Spaniards which lay on their frontiers, in a town called *Valentia de Alcantara*. On the 27th of August, the town was surpris'd; the general was taken who intended to have commanded in the invasion, together with one colonel, two captains, and 17 subaltern officers. One of the best regiments in the Spanish service was also entirely destroyed; and thus the enemy were in all probability prevented from entering Alentejo.

That part of the Spanish army which acted in the territory of Castell Branco had made themselves masters of several important passes, which they obliged some bodies of Portuguese to abandon. The combined army of British and Portuguese pretended to retire before them, in order to draw them into the mountainous

tract. They attacked the rear of the allies, but were repulsed with loss. Still, however, they continued masters of the country, and nothing remained but the passage of the Tagus to enable them to take up their quarters in the province of Alentejo. This the count designed to prevent; and in this service general Burgoyne was employed, who formed a design of surprising them. The execution was committed to colonel Lee, who, in the night of October 6th, fell upon their rear, dispersed the whole body with considerable slaughter, destroyed their magazines, and returned with scarce any loss. The season was now far advanced; immense quantities of rain fell; the roads were destroyed; and the Spaniards, having seized no advanced posts where they could maintain themselves, and being unprovided with magazines for the support of their hoists, every where fell back to the frontiers of Spain.

No less successful were the British arms in America and the East Indies. From the French were taken the islands of Martinico, St Lucia, St Vincent, and Granada; from the Spaniards, the strong fortress called *Havannah*, in the island of Cuba. By the acquisition of the first mentioned islands, the British became the sole and undisturbed possessors of all the Caribbees, and held that chain of innumerable islands which forms an immense bow, extending from the eastern point of Hispaniola almost to the continent of South America.

The conquest of the Havannah cost a number of brave men; more of whom were destroyed by the climate than the enemy. It was in this place that the fleets from the several parts of the Spanish West Indies, called the *galloons* and *flota*, assembled, before they finally set out on their voyage for Europe. The acquisition of this place, therefore, united in itself all the advantages which can be acquired in war. It was a military the greatest naval victory, by its effect on the enemy's marine; and in the plunder it equalled the produce of a national subsidy. Nine of the enemy's men of war, with four frigates, were taken; three of their capital ships had been sunk in the harbour at the beginning of the siege; two more were on the stocks in great forwardness, and these were destroyed. In money and valuable merchandises, the plunder did not fall short of 3,000,000l. sterling. To this success in the western part of the world may be added the capture of the Spanish register-ship called the *Hermione*, by the Active and Favourite king's ships. This happened on the 21st of May 1762, just as she was entering one of the ports of Old Spain, and the prize was little short of 1,000,000l. sterling.

In the East Indies an expedition was undertaken against the Philippine islands, which was committed to colonel Draper, who arrived for this purpose at Madrats in the latter end of June 1762. The 79th regiment was the only regular corps that could be spared for this service. Every thing was conducted with the greatest celerity and judgment. The British forces landed on Manilla on the 24th of September; on the 6th of October the governor was obliged to surrender at discretion; and soon after, the galloon bound from Manilla to Acapulco, laden with rich merchandise, the value of more than half a million, was taken by two frigates called the *Argo* and *Panther*. By the conquest

Britain. of Manilla, 14 considerable islands fell into the hands of the British; which from their extent, fertility, and convenience of commerce, furnished the materials of a great kingdom. By this acquisition, joined to our former successes, we secured all the avenues of the Spanish trade, and interrupted all communications between the parts of their vast but unconnected empire. The conquest of the Havannah had cut off, in a great measure, the intercourse of their wealthy continental colonies with Europe; the reduction of the Philippines excluded them from Asia: and the plunder taken was far more than sufficient to indemnify the charges of the expedition; a circumstance not very common in modern wars. It amounted to upwards of a million and a half; of which the East India company, on whom the charge of the enterprize in a great measure lay, were by contract to have a third part.

450
Vast extent of the British dominions.

All this time the war in Germany had continued with the utmost violence; the allies under prince Ferdinand had continued to give the highest proofs of their valour, but no decisive advantage could be obtained against the French. It was, however, no longer the interest of Britain to continue a destructive war. There never had been a period so fortunate or glorious to this island. In the course of this war she had conquered a tract of continent of immense extent. Her American territory approached to the borders of Asia, and came near to the frontiers of the Russian and Chinese dominions. She had conquered 25 islands, all of them distinguishable for their magnitude, their riches, or the importance of their situation. By sea or land she had gained 12 battles, had reduced nine fortified cities, and near 40 castles and forts. She had taken or destroyed above 100 ships of war from her enemies, and acquired at least L. 10,000,000 in plunder.

451
Articles of the peace in 1763.

By such unexampled and wide extended conquests, it is no wonder that the French and Spaniards were desirous of a peace; which was at length concluded at Paris on the 10th of February 1763. The terms granted them were by many thought too favourable. The principal of them were, That the French king should relinquish all claims to Nova Scotia: that he should likewise give up all the country of Canada; and that for the future the boundary betwixt the British and French dominions in America should be fixed by a line drawn along the middle of the river Mississippi from its source to the river Ibberville, and from thence drawn by a line along the middle of this river, and the lakes Maurepas and Pontchartrain, to the sea. The islands of St Pierre, Miquelon, Martinico, Guadaloupe, Marigalante, Desirade, St Lucia, and Belleisle, were restored to France; Minorca, Granada, and the Grenadines, St Vincent, Dominica, and Tobago, were ceded to Britain. In Africa, the island of Goree was restored to France; and the river Senegal, with all its forts and dependencies, ceded to Great Britain. In the East Indies, all the forts and factories taken from the French were restored. In Europe, the fortifications of Dunkirk were to be destroyed; and all the countries, fortresses, &c. belonging to the electorate of Hanover, the duke of Brunswic, and the count of La Lippe Buckeburg, restored. With regard to Spain, the British fortifications on the bay of Honduras were to be demolished; and the Spaniards were to desist from their claim of a right to

170 57.

Britain. sith on the Newfoundland bank. The Havannah was restored; in consequence of which, Florida, St Augustine, and the bay of Pensacola, were ceded to Britain, and the Spaniards were to make peace with Portugal: all other countries not particularly mentioned were to be restored to their respective owners at the beginning of the war.

Britain.

The conclusion of the war did not by any means tend to heal those divisions which had arisen on the resignation of Mr Pitt; on the contrary, it furnished abundant matter of complaint for the discontented party, whose views seem at that time only to have been the embarrassment and disturbance of an administration which they were not able to subvert. At the time the treaty was under consideration, however, only some faint attempts were made to oppose it; but it soon appeared, that though this opposition had proved so feeble, the spirit of the party was far from being exhausted. The state of affairs at that time indeed greatly favoured the views of those who delighted in turbulence and faction. A long and expensive war had drained the national treasure, and greatly increased the public debt. Heavy taxes had already been imposed, and it was still as necessary to keep up these, and even to impose new ones, as though the war had not ceased. Thus the bulk of the nation, who imagined that conquest and riches ought to go hand in hand, were easily induced to believe that administration arbitrary and oppressive, which continued to load them with fresh taxes after such great successes as had attended the British arms for some years past.

462
Discontent increased the conclusion of the treaty.

It must indeed be owned, that the new administration appear not to have been sufficiently wary in this respect. Among other methods of raising the supplies for 1763, they had thought proper to lay a duty of four shillings per hoghead upon cyder, payable by the maker, and to be collected in the same manner as other excises. The other articles of supply furnished also matter of declamation for the members in opposition; but this inflamed the popular fury to a great degree, and made them readily imbibe as truth whatever was thrown out by the minority in their parliamentary debates. Besides the usual declamations that it was oppressive, unconstitutional, and injurious to the landholder and farmer, the smallness of the sum to be raised by it was now urged. This was said to indicate that the supplying the wants of government could not be the sole motive for imposing such a duty. It was farther urged, with much show of lamentation, that now the houses of all orders of people, noblemen of the first rank not excepted, were liable to be entered and searched at the pleasure of excisemen, a proceeding which they denominated in express terms "a badge of slavery." Thus it was spoken of throughout all the cyder counties, by the city of London, and by most of the incorporations throughout the kingdom. The city had been displeas'd by the late changes in administration, and had not yet recovered their good humour. They instructed their representatives to oppose the passing of the bill with all possible vigour, and gave in petitions against it to every branch of the legislature; a measure till that time totally unprecedented; two protests were also entered against it in the house of lords; and in short the kingdom of England was thrown into an almost universal ferment.

463
Great clamour raised by the cyder-tax.

It

Britain.

It is not to be doubted that the friends of administration were able to bring arguments sufficiently plausible in favour of their scheme; but the utmost force of reason will go but a very little way in quieting popular clamour; and, while opposition was railing against ministry within doors, every method was taken to excite the fury of the people without. Virulent libels, the audacity of which far exceeded any thing known in former times, now made their appearance; and such was the general intemperance in this respect, that it would be difficult to determine which side paid least regard to any kind of decency or decorum.

might act as the passive instruments of the late minister, who, though, from considerations of his own personal safety, he had thought proper to retire from business, yet had not abandoned his ambitious projects, but continued to direct every thing as though he had still been present. Opposition to the new ministers was therefore opposition to him; and it became those who understood the true interest of their country, and had a real regard for it, not to suffer such a scheme of clandestine administration.

Bute

of a minister
administration.

464
Resignation
of the
earl of
Bute.

In the midst of this general ferment the earl of Bute unexpectedly resigned his place of first lord of the treasury. His resignation quickly became an object of general speculation; by some he was highly censured for leaving his friends at the time when a little perseverance might have defeated all the designs of his enemies, and established his own power on the most solid foundation. Such conduct, they said, must discourage the friends of government, and at the same time give proportionable encouragement to its adversaries to insult it, as they perceived ministry unable to resist the first gust of popular fury. Others contended, that the earl was, perhaps, the least influenced by popular opinion of any man in the world. He had demonstrated his firmness by taking a lead in the dangerous but necessary affair of concluding peace; and, this being accomplished, he had fully obtained his end, and performed the service to his country which was desired. He now resolved that the factious party should not have even the pretence of objecting his personal ambition as the cause of disturbances which they themselves had excited; and thus his resignation would tend to put an end to these troubles, at the same time that it showed the authors of them in their proper colours.

Whether the party who made these assertions really believed them or not cannot be known; but the effect was exactly the same as though they had. The great object of both parties most probably was power; but their different situations required that they should profess different political principles. The friends of lord Bute and of the succeeding administration were for preserving to the crown the full exercise of a power which could not be disputed, viz. that of choosing its own servants. Their opponents, without denying this power, contended, that, according to the spirit of the constitution, the crown should be directed to the exercise of this public duty only by motives of national utility, and not by private friendship. In appointing the officers of state, therefore, they insisted, that respect should be paid to those possessed of great talents, who had done eminent services to the nation, enjoyed the confidence of the nobility, and had influence amongst the landed and mercantile interests. The observance of this rule, they contended, was the only proper balance which could be had against the enormous influence of the crown arising from the disposal of so many places; nor could the nation be recommended to this power by any other means than a very popular use of it. Men might indeed be appointed according to the strict letter of the law; but unless there were men in whom the majority of the nation already put confidence, they never would be satisfied, nor think themselves secure against attempts on the constitution of the kingdom. When ministers also found themselves recommended to the royal favour, and as it were presented to their places by the esteem of the people, they would be studious to deserve, and secure themselves in it; and upon these (which they called the principles of whigs) they said that the government had been honourably conducted since the revolution, and the nation would never be at peace till they were again established on the same basis.

465
Popular
ferment
still continues.

The event, however, showed that the former reasoning was, in the present case, nearest the truth. The popular resentment was not in the least abated by the resignation. His lordship, though now withdrawn from the ostensible administration of affairs, was still considered as principal director of the cabinet; and this opinion gained the more ground that none of the popular leaders were yet taken in, nor any apparent change made in the conduct of the new administration.

No reasonable objection could now be made to those who filled the great offices of state. Mr Grenville, who succeeded the earl of Bute in the treasury, was a man of approved integrity, understanding, and experience. Lord Holland was universally considered as a very able man in office, and had already filled many high employments with a great degree of reputation. The other secretary lord Egremont, though he had not been long in office, was in every respect of an unexceptionable character. The other departments were filled in a similar manner, yet the discontents and public clamours were not diminished. It was now said that the new ministers were not chosen on account of any superior gifts of nature or fortune, but merely because they had the art of insinuating themselves into favour at court in such a manner that any inconvenience would be submitted to rather than part with them. The sole reason of their appointment therefore was, that they

466
Characters
of the new
ministers.

In the mean time the disposition to libel and invective seemed to have gone beyond all bounds. The peace, the Scots, and Scottish administration, afforded such subjects of abuse to the pretended patriot, that ministry resolved at last to make an example of one of them by way of deterring the rest from such licentiousness. For this purpose the paper called the North Briton was made choice of, which, in language much superior to any other political work of the time, had abused the king, the ministry, and the Scots in an extravagant manner. One particular paper (N^o XLV.) was deemed by those in power to be actionable, and Mr Wilkes, member of parliament for Aylesbury, was supposed to be the author. A warrant was therefore granted for apprehending the author, publisher, &c. of this performance, but without mentioning Wilkes's name. In consequence of this, however, the

⁴⁷⁰ messengers entered his house on the night between the 29th and 30th of April 1763, with an intention to seize him. He objected, however, to the legality of the warrant, because his name was not mentioned in it, and likewise to the lateness of the hour; and, on threatening the messengers with violence, they thought proper to retire for that night. Next morning he was apprehended without making any resistance, though some violence was necessary to get him into an hackney coach, which carried him before the secretaries of state for examination.

⁴⁷⁰ Messengers proceeded against him

On the first intimation of Mr Wilkes being in custody, application was made for an *habeas corpus*; but as this could not be sued out till four in the afternoon, several of his friends desired admittance to him, which was peremptorily refused on pretence of an order from the secretaries of state. This order, however, though repeatedly demanded, could not be produced, or at least was not so; on which account the gentlemen, conceiving that they were not obliged to pay any regard to messengers acting only by a verbal commission, entered the place where he was without farther question.

This illegal step was quickly followed by several others. Mr Wilkes's house was searched, and his papers seized in his absence; and though it was certain that an *habeas corpus* was now obtained, he was nevertheless committed to the Tower. Here not only his friends, but even several noblemen and gentlemen of the first distinction, were denied access, nor was his own brother allowed to see him more than others. On the third day of May he was brought before the court of common pleas, where he made a most patriotic speech, setting forth the love he had for his majesty, the bad conduct of ministry, not forgetting his own particular grievances, and that he had been treated "worse than a Scotch rebel." His case being learnedly argued by several eminent lawyers, he was remanded to the Tower for three days; after which he was ordered to be brought up, that the affair might be finally settled.

⁴⁷² Deprived of his commission as colonel of the Buckinghamshire militia.

Next day lord Temple received a letter from secretary Egremont, informing him, that the king judged it improper that Mr Wilkes should continue any longer a colonel of the Buckinghamshire militia; and, soon after, Temple himself was removed from being lord lieutenant of that county. Mr Wilkes then being brought to Westminster Hall at the time appointed, made another flaming speech; after which the judges took his case into consideration. Their opinion was, that the warrant of a secretary of state was in no respect superior to that of a common justice of peace; and, on the whole, that Mr Wilkes's commitment was illegal. It was likewise determined that his privilege as member of parliament was infringed: this could not be forfeited but by treason, felony, or breach of the peace; none of which was imputed to him; for a libel, even though it had been proved, had only a tendency to disturb the peace, without any actual breach of it. Thus it was resolved to discharge him; but, before he quitted the court, a gentleman of eminence in the profession of the law stood up and acquainted the judges, that he had just received a note from the attorney and solicitor general, intreating his lordship not to give Mr Wilkes leave to depart till they came, which would be instantly, as they had

⁴⁷³ Discharged, and his commitment declared illegal.

something to offer against his plea of privilege. This motion, however, being rejected, the prisoner was set at liberty. ^{Britain.}

Mr Wilkes had no sooner regained his freedom than he showed himself resolved to make all the advantage he could of the errors committed by the ministry, and to excite as general a ferment as possible. For this purpose he wrote a very impudent letter to the earls of Egremont and Halifax, informing them, that his house had been robbed, and that the *stolen goods* were in the possession of one or both of their lordships, insisting upon immediate restitution. This letter was printed, and many thousand copies of it dispersed; soon after which an answer by the two noblemen was published in the newspapers, in which they informed him of the true cause of the seizure of his papers, that his majesty had ordered him to be prosecuted by the attorney general, and that such of his papers as did not lead to a proof of his guilt should be restored. This was quickly succeeded by a reply, but the correspondence ceased on the part of their lordships. Mr Wilkes, however, erected a printing press in his own house, where he advertised the proceedings of the administration with all the original papers, at the price of a guinea. The North Briton now again made its appearance; the popular party were elated beyond measure with their success; those who had suffered by general warrants sought redress at law, and commonly obtained damages far beyond not only their real sufferings, but even beyond their most sanguine expectations. During the whole summer, the minds of the people were kept in continual agitation by political pamphlets and libels of various kinds, while the affair of general warrants so engrossed the general attention, that by the time the parliament sat down, November 15th 1763, scarce any other subject of conversation could be started in company.

On the meeting of parliament his majesty mentioned in his speech the attempts that had been made to divide the people; and before the addresses could be made in return, a message was sent to the commons, informing them of the supposed offence of Mr Wilkes, and of the proceedings against him, the exceptionable paper being also laid before the house. After warm debates, the North Briton was deemed a false, scandalous, and seditious libel, tending to excite traitorous insurrections, &c. This was followed by another, that the privilege of parliament does not extend to the writing and publishing of seditious libels, nor ought to obstruct the ordinary course of the laws in the speedy and effectual prosecution of so heinous and dangerous an offence. It did not, however, pass the house of commons without a vigorous opposition, and seventeen members of the upper house protested against it.

⁴⁷⁵ Proceedings against him in parliament.

The North Briton N^o XLV. being condemned as already mentioned, was ordered to be burnt by the hangman; but this could not be done without great opposition from the mob. The executioner, constables, officers, and even the chief persons concerned, were pelted with filth and dirt, and some of them insulted in the grossest manner. Mr Harley, one of the high sheriffs and member of parliament for London, was wounded by a billet tak: from the fire; the staves of the constables were broken; and the whole officers and executioner driven off the field, while the remains of

⁴⁷⁶ Disturbances on burning the North Briton.

the paper were carried off in triumph from the flames, and in return, a large jack-boot was burnt at Temple-bar, while the half-burnt North Briton was displayed amidst the acclamations of the populace.

477
The under secretary lined for seizing Mr Wilkes's papers.

Mr Wilkes, in the mean time, determined to make the best use of the victory he had already gained, and therefore commenced a prosecution in the court of common pleas against Robert Wood, Esq; the under secretary of state, for seizing his papers. The cause was determined in his favour, and Wood condemned in 1000 l. damages, with full costs of suit.

478
Mr Wilkes prosecuted, wounded in a duel, and outlawed.

The prosecution with which Mr Wilkes had been threatened was now carried on with great vigour; but in the mean time, having grossly affronted Samuel Martin, Esq; member for Camelford, by his abusive language in the North Briton, he was by that gentleman challenged, and dangerously wounded in the belly with a pistol bullet.—While he lay ill of his wound, the house of commons put off his trial from time to time; but beginning at last to suspect that there was some collusion betwixt him and his physician, they enjoined Dr Heberden, and Mr Hawkins an eminent surgeon, to attend him, and report his case. Mr Wilkes, however, did not think proper to admit a visit from these gentlemen; but soon after took a journey to France to visit his daughter, who, as he gave out, lay dangerously ill at Paris.

The commons having now lost all patience, and being certified that he had refused to admit the physician and surgeon sent by them, proceeded against him in his absence. The evidence appearing quite satisfactory, he was expelled the house, and a prosecution afterwards commenced against him before the house of lords, on account of an obscene and blasphemous pamphlet, in which he had mentioned a reverend and learned bishop in a most shameful manner. The event of all was, that, failing to appear to answer the charges against him, he was outlawed, which, it was then supposed, would for ever consign his patriotism to oblivion.

479
A general spirit of licentiousness bill prepared.

The extreme severity shown to Mr Wilkes did not at all extinguish the spirit of the party. A general insatiation in favour of licentious and abusive writings seemed to have taken place; and to publish libels of this kind without the least regard to truth or justice was called *liberty*. At the very time that Mr Wilkes was found guilty of publishing the infamous pamphlet above mentioned, the common council of London presented their thanks to the city representatives for their zealous and spirited endeavours to assert the rights and liberties of the subject, "by their laudable attempt to obtain a reasonable and parliamentary declaration, That a general warrant for apprehending and seizing the authors, printers, and publishers of a seditious libel, together with their papers, is not warranted by law." Their gratitude they showed to lord chief justice Pratt, for his decision in Wilkes's affair, by presenting him with the freedom of the city, and desiring him to sit for his picture to be placed in Guildhall. These extravagant proceedings, however, did not pass without strong opposition, and were considered by the sober part as highly unjust and improper, as well as indecent.

The violent clamours which had been excited and still continued, though in a less violent degree, did not prevent admiration from paying that attention to

the exigencies of the nation which its present situation undoubtedly required. The practice of franking blank covers to go free per post to any part of Great Britain or Ireland, had arisen to an incredible height, and greatly prejudiced the revenue. The hands of members of parliament were not only counterfeited, but the covers publicly sold without the least scruple; and, besides this, the clerks of the post office claimed a privilege of franking, which extended even farther than that of the members of the house; the latter being restricted to a certain weight, but the former denying that they were subject to any restriction of this kind. The matter, however, was attended with considerable difficulty when it came to be examined in the house of commons. It was found, that though the vast increase of franks was detrimental to one branch of the revenue, it was serviceable to another by the immense consumption of stamps it occasioned; but at last the following act was passed as an effectual remedy, viz. That from the 1st of May 1764, no letters or packets should be exempted from postage, except such as were sent to or from the king; or such as, not exceeding two ounces in weight, should be signed by a member of either house, the whole of the superscription being in his own hand-writing; or such as should be directed to members of parliament, or other persons specified in the act. It was likewise enacted, that printed votes and proceedings in parliament, sent without covers, or in covers open at the files, and only signed on the outside by a member, should go free, though such packets were liable to be searched; and to give the greater force to these regulations, it was made felony and transportation for seven years to forge a frank. At this time it was proved, that the annual postage of letters sent free would amount to 70,000 l. and that the profits accruing to the clerks of the post office amounted to between 800 and 1700 l. each.

Other plans for augmenting the revenue were that for settling the island of St John, and for the sale of the lately acquired American island. The former was proposed by the earl of Egmont, who presented a memorial to his majesty on the subject. In this he desired a grant of the whole island of St John's, in the gulf of St Lawrence, to hold the same in fee of the crown for ever; specifying particularly the various divisions, government, &c.; but, for reasons unknown, the plan was never put in execution. The sale of the conquered lands took place in March 1764. These were particularly the islands of Grenada, the Grenadines, Dominica, St Vincent, and Tobago. Sixpence an acre was to be paid as a quit-rent for cleared lands, and a penny a foot for ground-rent of tenements in towns, and sixpence an acre for fields; but no person was to purchase more than 300 acres in Dominica, or 500 in the other islands.

One of the most remarkable transactions of this year was the renewal of the charter of the bank, for which the latter paid the sum of 1,100,000 l. into the exchequer as a present to the public, besides the advancing a million to government upon exchequer bills. Another affair, however, was the consideration of methods to raise a revenue upon the American colonies. This had been formerly proposed to Sir Robert Walpole; but that prudent minister wisely declined to cater into

Britain

such a dangerous affair, saying, that he would leave the taxation of the colonies to those who came after him in office. The reason given for such a proceeding was the defraying the necessary charges of defending them, which, though extremely reasonable in itself, was done in such a manner as excited a flame not to be extinguished but by a total loss of the authority of the parent state. Before this time, indeed, hints had been thrown out, that it was not impossible for the colonists to withdraw their dependence on Britain; and some disputes had taken place betwixt the different provinces, which were quieted only by the fear of the French, and seemed to prognosticate no good. It was thought proper therefore now, when the colonies were not only secured but extended, to make the experiment whether they would be obedient or not. They contained more than two millions of people, and it was evidently necessary to raise a revenue from such a numerous body. Some thought it might be dangerous to provoke them; but to this it was replied by administration, that the danger must increase by forbearance; and as taxation was indispensable, the sooner the experiment was made, the better. The fatal trial being thus determined, an act was passed for preventing smuggling, so that the duties laid on the American trade might come into the hands of government. At this time an illicit trade was carried on betwixt the British and Spanish colonies, which seemed to bid defiance to all law and regulation; and was no less disagreeable to the Spanish than to the British court. In some respects, however, the suppression of this was very inconvenient, and even intolerable, to the colonists; for as the balance of trade with Britain was against them, it was impossible they could procure any specie, except by trading with the Spaniards, from whom they were paid for their goods in gold and silver. This, and another act requiring them to pay certain duties in cash, was probably the reason of that excessive resentment shown by the Americans to government, and their absolute refusal to submit to the stamp-act which was also passed this year.

notice, that the opposition of the colonists proved very distressing to the mother country, on account of the vast sums they owed. At this time they were indebted to the merchants of London four millions Sterling; and so ready were the latter to give them credit, that some of the American legislatures passed acts against incurring such credit for the future. A petition on the subject was presented to the house of commons; but, as it denied the parliamentary right of taxation, it was not allowed to be read. It was then proposed, on the part of administration, that the agents should join in a petition to the house for their being heard by counsel in behalf of their respective colonies against the tax. The agents, however, not thinking themselves empowered to grant such a petition, the negotiation was broken off, and matters went on in America as we have elsewhere related.

In other respects, the ministry took such steps as were undeniably proper for supporting the honour and dignity of the nation. Some encroachments having been made by the French and Spaniards, such remonstrances were made to their respective courts, that satisfaction was quickly made; and though every trifle was sufficient to open the mouths of the popular party, it was impossible as yet to find any just cause of complaint. The disposition to tumult and insurrection, however, seems to have been now very general. The silk-weavers residing in Spitalfields being distressed for want of employment, which they supposed to proceed from the clandestine importation of French silks, laid their case before his majesty in the year 1764, who graciously promised them relief. The sufferers were relieved by the bounty of the public; but this seemed to render the matter worse, by confirming them in habits of indolence and idleness. At the same time, a bill, which was supposed to tend to their relief, being thrown out, they began to assemble in vast numbers, which, gradually increasing, are said to have amounted at last to 50,000; several disorders were committed, and it was not without the assistance of the soldiery, and the utmost vigilance of the magistrates, that the riot could be suppressed.

During this insurrection the ferment betwixt the court and popular parties continued with unabated vigour. The ministers were still attacked in numberless publications, and accused as being merely dependents and substitutes to the earl of Bute; nor could the utmost care on the part either of that nobleman or the ministers blunt the shafts of calumny and misrepresentation. An accident, however, now produced a considerable revolution at court, though it had very little effect in calming the minds of the people. This was an illness with which the king was seized in the beginning of the year, which filled the public with apprehensions, and produced a bill for settling the affairs of the kingdom in case of the crown falling into the hands of a minor. In settling this bill, ministers were said to have behaved with very little respect to the princess-dowager of Wales, and industriously to have excluded her from a share of the government. These proceedings were thought in a great measure to have alienated the affection of his majesty from the ministry, who had hitherto been in great favour: Nor did their subsequent conduct show them to be at all desirous of regaining what they had lost. They now contrived to

486 The Isle of Man purchased by government.

487 A general animosity against government both in Britain and America.

The augmentation of the revenue being the principal object of administration at this time, the suppression of smuggling at home, as well as in America, was taken into consideration. Though the great number of cutters and other vessels fitted out by government for this purpose had produced very salutary effects, the Isle of Man, which belonged to the duke of Athol, and was not subject to the custom-house laws, lay so conveniently for the purposes of smuggling, that the utmost vigilance of government was not sufficient to suppress it. The event was a treaty betwixt government and the duke, by which the latter, for a sum of money, ceded all the sovereignty in the island he could claim, and cutters were placed on the coasts and in the harbours of the island as in other places of the kingdom. This disposition to augment the revenue by all possible methods, seems to have served to keep up the general opinion of the oppressive and arbitrary measures about to be pursued by government. The ill humour of the British patriots still continued; and the stamp bills were received in America with the utmost indignation. The arguments for and against American taxation are now of no importance; and the particulars of their opposition are related under the article *United States of America*. Here we shall only take

have

have the earl of Bute's brother turned out of a very lucrative post which he enjoyed in Scotland, and in which he had never given the least cause of complaint. A step of this kind could not be agreeable to his majesty, nor could it recommend them to the popular party in England, who always manifested a perfect indifference as to what passed in Scotland. On this occasion lord Chatham is said to have been solicited again to accept the office which he had formerly filled so much to the satisfaction of the nation, and to have declined it.

A new ministry, however, was soon formed, at the recommendation of the duke of Cumberland. The duke of Grafton and the honourable Mr Conway, brother to the earl of Hertford, were appointed secretaries of state, the marquis of Rockingham first lord of the exchequer, and Mr Dowdeswell chancellor and under treasurer of the exchequer. The office of lord privy seal was conferred on the duke of Newcastle, and all other places were filled with men not only of known integrity, but such as were agreeable to the people. These changes, however, were not yet able to give satisfaction. The opinion that affairs were still managed by the earl of Bute continued to prevail, and was indulluriously kept up by the political writers of the time. The city of London expressed their discontent on the occasion of addressing his majesty on the birth of a third son. They now took the opportunity of assuring him of "their faithful attachment to his royal house, and the true honour of his crown, wherever a happy establishment of public measures should present a favourable occasion; and that they would be ready to exert their utmost abilities in support of such wise councils as apparently tended to render his majesty's reign happy and glorious."

These expressions showed such an evident disapprobation of his majesty's choice, that it could not fail to offend both king and ministry; but before the latter could show any token of resentment, they lost their great friend and patron the duke of Cumberland. His death happened on the 31st of October 1765. He had been that evening assiling at one of those councils frequently held in order to put matters in a way of being more speedily dispatched by the privy council; where being seized with a sudden disorder of which he had some symptoms the evening before, he fell senseless in the arms of the earl of Albemarle, and expired almost instantaneously. His death was greatly lamented, not only by their majesties, but by the whole nation, being universally esteemed not only as a brave commander, but an excellent member of society, an encourager of industry, and an active promoter of the arts of peace.

In the mean time, the discontent which inflamed the American colonies continued still to agitate the minds of the people of Great Britain; nor indeed was it reasonable to expect that they could be lulled in their present condition; commerce being almost entirely destroyed, manufactures at a stand, and provisions extravagantly dear. The vast sums owing to the British merchants by the Americans also severely affected the trading and manufacturing part of the country. These, amounting to several millions, the colonies absolutely refused to pay, unless the obnoxious laws should be repealed. Administration were therefore under the necessity of instantly enforcing the stamp act by fire and sword, or of procuring its imme-

diately repeal in parliament. The loss of the duke of Cumberland was now severely felt, as he had been accustomed to assist administration with his advice, and was highly respected by the nation for his good sense. At this period, however, it is doubtful if human wisdom could have prevented the consequence which ensued. Administration endeavoured, as much as perhaps was possible, to avoid the two extremes, either of rushing instantly into a civil war, or of sacrificing the dignity of the crown or nation by irrelolation or weakness. They suspended their opinion until they should receive certain intelligence from the American government how affairs stood in that country; and their letters on that occasion still do them honour. The opposite party animadverted severely on this conduct. They insisted on having the most coercive methods immediately put in execution for enforcing the laws in which they themselves had so great a share; and it is probable that they wished matters to come to extremities before the sitting down of parliament. Pacific measures, however, at this time prevailed: the stamp act was repealed; but at the same time another was made, declaring the right of parliament not only to tax the colonies, but to bind them in all cases whatsoever.

The repeal of the stamp act occasioned universal joy both in Britain and America, though, as parliament insisted upon their right of taxation, which the opposite party denied, matters were still as far from any real accommodation as ever. This ill humour of the Americans was soon after augmented by the duties laid upon glass, painters colours, and tea, imposed into their country, while at home the dearth of provisions, and some improper steps taken by ministry to remedy the evil, kept up the general outcry against them. A general disposition to tumult and riot still continued; and unhappily the civil power now seemed to lose its force, and a general anarchy, under the name of liberty, to be approaching.

In this state of affairs administration were once more disturbed by the appearance of Mr Wilkes, who had returned from his exile, and, on the dissolution of parliament in 1768, though an outlaw, stood candidate for the city of London. He was received by the populace with loud acclamations, and several merchants and people of large property espoused his cause, and a subscription was entered into for the payment of his debts. He failed, however, in his design of representing the city of London, but instantly declared himself a candidate for Middlesex. The tumults and riots which now took place were innumerable; and such was the animosity betwixt the two parties, that a civil war seemed to be threatened. Our laws would not allow of any party in detail of these transactions. It will be sufficient to take notice, that on a legal trial the outlawry of Mr Wilkes was reversed, and he was condemned for his offences to pay a fine of 1000*l.* and to be imprisoned for twelve months. He was favored by the people, however, and powerfully supported, he was repeatedly chosen member for Middlesex, and a member rejected by the house of commons. The tumults on this occasion were not always duly and orderly conducted; and the interposition of the ministry was construed by the patriots as an indication of a design to establish ministerial authority by the most barbarous methods. In short, the behavior of the people of England and America was at the time so very much unke-

tain. mini- recom- ded by Duke of ber-

The discusions which had so long prevailed in the kingdom did not pass unnoticed by the other European powers, particularly the French and Spaniards. Both had applied themselves with assiduity to the increase of their marine; and many began to prognosticate an attack from one or other of both of these nations. The Spaniards first showed an inclination to come to a rupture with Britain. The subject in dispute was a settlement formed on Falkland's islands*, near the southern extremity of the American continent. A scheme of this kind had been thought of as early as the reign of Charles II. but it was not till after lord Anson's voyage that much attention had been paid to it. In the printed account of it, his lordship showed the danger incurred by our navigators through the treachery of the Portuguese in Brazil; and that it was a matter of the greatest importance to discover some place more to the southward, where ships might be supplied with necessaries for their voyage round Cape Horn; and, among others, he pointed out Falkland's islands as eligible for this purpose. When at the head of the admiralty, his lordship also forwarded the scheme as much as possible; and some preparations were made for putting it in execution: but as it met with opposition at home, and gave offence to the court of Madrid, it was laid aside till the year 1764, when it was revived by lord Egmont. Commodore Byron being then sent out with proper necessaries, took possession of them in the name of his majesty, and represented them in a favourable light; while his successor, captain M'Bride, affirmed, that the soil was utterly incapable of cultivation, and the climate intolerable.

Be this as it will, the islands in question had attracted also the notice of the French. So low, however, had the nation been reduced by the late war, that no project of the kind could yet be put in execution at the public expence. M. Bougainville, therefore, with the assistance of his friends, undertook to form a settlement on Falkland's islands at their own risk. The scheme was put in execution in the beginning of the year 1764; and a settlement formed on the eastern part of the same island where commodore Byron had established an English colony on the western side. His account of the country was still more favourable than that of the English commander; but as the project had been undertaken with a view to other discoveries and advantages, which probably did not turn out according to expectation, the French adventurers soon became weary of their new colony; to which also the displeasure of the Spaniards, who were greatly offended, did not a little contribute. M. Bougainville, therefore, being reimbursed in his expences, and the French having given up every claim of discovery or right of possession, the Spaniards landed some troops in 1766, took possession of the fort built by the French, and changed the name of the harbour from Port Louis to Port Solidad.

In the year 1769, captain Hunt of the Tamar frigate, happening to be on a cruize off Falkland's islands, fell in with a Spanish schooner which had been at Port Solidad. During all this time, it is uncertain whether the British and Spanish settlers knew of one

another or not. From the behaviour of captain Hunt we should suppose that they did not; as he charged the commander of the schooner to depart from that coast, being the property of his Britannic majesty. The schooner, however, soon returned, bringing an officer from the governor of Buenos Ayres, who gave the like warning to captain Hunt to depart from the coast, as belonging to the king of Spain. Some altercation ensued; but captain Hunt, not choosing to carry matters to extremities, set sail for England, where he arrived in June 1770.

At the departure of captain Hunt, two frigates were left at Falkland's islands. One of these was lost in a short time after; and on the fourth of June 1770, a Spanish frigate arrived at the English settlement named *Fort Egmont*, with a number of guns and other warlike utensils for carrying on a regular siege. In three days, four other frigates arrived, laden in the same manner; so that the English commander, captain Farmer, finding all resistance vain, was obliged to capitulate. The English were ordered to depart within a limited time, carrying with them what stores they could; and the Spanish commander declared himself answerable for what they should leave on the island. The time allowed them to remain at Port Egmont was to be determined by the governor; and for the greater security, the rudder was taken off from captain Farmer's ship, and kept on shore till the appointed period; after which the frigate was permitted to depart, and in 70 days arrived at Portsmouth.

An insult to the British flag, so audacious, seemed to render war inevitable unless proper reparation was very speedily made. It was accordingly mentioned in the speech from the throne, November 13th 1770; and an immediate demand of satisfaction for the injury was promised, and that the necessary preparations for war, which had been begun, should not be discontinued. The affairs of America were also taken notice of, where grounds of complaint still existed, notwithstanding the cessation of those combinations which had distressed the commerce of this country. These promises, with regard to the affair of Falkland's islands, however, were far from giving general satisfaction. The speech, as the work of ministry, was most violently attacked by opposition; and an address in answer to it, it was said, would be an eulogium on ministers who did not deserve it. News had arrived, they said, from Falkland's islands in June, which sufficiently demonstrated the designs of Spain; and Gibraltar and Minorca were left open to the attacks of that power, without any preparation being made on our part to resist them. The whole conduct of the ministry was said to be pusillanimous; and the love of peace, which was given out as the reason of their unwillingness to resent the injury, was treated with contempt.

A motion was now made in both houses for an inquiry into the conduct of the Spaniards on this occasion, and that all the papers and letters relative to it should be laid before parliament. The demand, however, was opposed by ministry, who insisted that the laws of negotiation precluded the idea of exposing any letters or papers sent in confidence while the negotiation was depending; and they asserted that the king of Spain had disavowed the conduct of his officer, and promised satisfaction. It would have been rash, they

tain- said, to proceed to extremities betwixt the two crowns, when perhaps the officer only was to blame; but if, after remonstrance, the court of Spain refused satisfaction, we were then authorized to force that justice which was refused in an amicable manner.

Some time before this, Mr Harris, the English minister at the court of Madrid, dispatched a letter to lord Weymouth, informing him that a ship had arrived from Buenos Ayres with an account of the intended expedition against Port Egmont, the number of men to be employed, and the time fixed for its departure; at the same time that it was asserted by prince Masferans, the Spanish ambassador, that he had every reason to believe that the governor of Buenos Ayres had employed force at Port Egmont without any orders; and hoped that, by disavowing this proceeding, he might prevent any misunderstanding betwixt the two kingdoms. To this his lordship replied in a spirited manner, asking, among other things, Whether the prince had any orders to disavow the proceedings of the governor? And, on his reply in the negative, a formal disavowal was demanded. After some time, his lordship was informed that the prince had orders to disavow any particular orders given to Mr Buzarelli, the governor of Buenos Ayres, and at the same time to say, that he had acted agreeably to his general instructions and oath as governor; that the island should be restored; and that it was expected the king of Britain would, on his part, disavow the conduct of captain Hunt, whose menace had induced the governor to act as he did.

This reply did not by any means prove agreeable; and soon after the conduct of the court of Spain became so suspicious, that Mr Harris was ordered to quit the court of Madrid; and the correspondence between prince Masferans and the court of England was no longer continued. About this time lord Weymouth resigned his office, and was succeeded by the earl of Rochford; and the affair of Falkland's islands was no longer openly spoken of. On the sitting down of the parliament, January 22d 1771, however, it was again brought before the house, and the declaration of the Spanish ambassador, with Rochford's acceptance, were announced. Prince Masferans then disavowed, in the name of his master, the violence used at Port Egmont; to the restitution of which he agreed, and hoped that this restitution would be looked upon as ample satisfaction, and at the same time as not affecting the question concerning the prior sovereignty of the islands. This produced a new demand for copies of all papers, letters, and declarations of every kind relative to Falkland's islands: but though it was now seemingly complied with, the opposite party affirmed that it was still only in part; for besides a chasm of near two months, during which time there was no account whatever, none of the copies of the claims or representations made by the court of Spain, since the first settlement of the islands, were given up. Thus a suspicion was produced, that the concealment of these papers, and the deficiencies in the order of their dates, might proceed from some misconduct during the periods in question; and which administration was willing to conceal from the world. To these objections it was replied, that every paper which could be found in the several offices had been presented; and that if there had been any

notice was taken in them, it must have been verbal; but, at any rate, there were papers sufficient to enable the house to determine the propriety or impropriety of their conduct throughout the whole transaction; for every thing decisive or explicit was in writing, and every writing was laid before them.

All these excuses, however, could not yet satisfy opposition. It was reported, and generally believed, that France had interposed in the affair; in consequence of which, a motion was made to address his majesty for information whether any such interference had taken place, and of what nature it was, or in what manner it had been conducted. The minister denied that there had been any such interference; but it was insisted that this was insufficient; that the word of the king was requisite, and that of the minister could not be satisfactory, even supposing him to be upright. It did not, however, appear that any correspondence in writing had taken place betwixt the two courts; and when the minister was asked, whether France had ever interposed as mediator? he answered, that "England had not employed France in that capacity; but that the word *interposed* was of a meaning too vague for direct explanation; and it was unusual to demand verbal negotiations, while papers were laid before them: That as all Europe had an eye to the compromising of differences betwixt states, it was not to be supposed that France would be altogether silent; but nothing (says he) dishonourable has ever passed." Opposition still insisted that they had a right to have an account of verbal negotiations as well as others; and that if this right was given up, a minister had no more to do, when he wished to promote an insidious measure, than to conduct it by verbal correspondence. The motion, however, was lost by a great majority in both houses.

This manner of deciding the question was so far from allaying the general ferment, that it rendered it much worse. The transaction was considered as entirely disgraceful to the British nation; nor were all the arguments that could be used by the ministerial party in any degree sufficient to overthrow the general opinion. The restitution of the island was thought to be an inadequate recompense for the affront that had been offered; and the objections to it were urged on a motion for an address to return thanks for the communication of the Spanish declaration, and to testify their satisfaction with the redress that had been obtained. This address was not carried without considerable difficulty, and produced a protest from 19 peers. On the part of Spain, however, every part of the agreement was ostensibly fulfilled; Port Egmont was restored, and the British once more took possession of it, though it was in a short time after evacuated, according to a private agreement, as was suspected, between ministry and the court of Spain; but of this no evidence ever appeared to the public.

In other respects, the great discontents raged throughout the kingdom. A fire which happened at Portsmouth in the year 1770 excited numberless jealousies, and was by some imputed to our enemies on the continent. The affair of the Middlesex election was never forgot; and, notwithstanding many repulses, the court of London still ventured to present new petitions to the throne. In one presented this year by Mr Beckford, the lord mayor at that time, they lamented the

Britain the heavy displeasure under which they seemed to have fallen with his majesty, and renewed a petition, frequently presented before, concerning a dissolution of parliament. This, however, met with a very unfavourable answer: his majesty informed the lord mayor, that his sentiments on that subject continued unchanged; and that "he should ill deserve the title of Father of his people, should he suffer himself to be prevailed on to make such an use of his prerogative as he could not but think inconsistent with the interest, and dangerous to the constitution, of the kingdom." Mr Beckford was so far from being disheartened by this answer, that he demanded leave to speak to the king; which being obtained, he made a speech of considerable length, and concluded with telling his majesty, that "whoever had already dared, or should hereafter endeavour, by false insinuations and suggestions, to alienate his majesty's affections from his loyal subjects in general, and the city of London in particular, was an enemy to his majesty's person and family, a violator of the public peace, and a betrayer of our happy constitution as it was established at the glorious revolution." To this no answer was made, though it gave great offence: and when Mr Beckford went afterwards to St James's with an address on the queen's safe delivery of a princess, he was told, that "as his lordship had thought fit to speak to his majesty after his answer to the late remonstrance; as it was unusual, his majesty desired that nothing of the kind might happen for the future."

510
His death.

511
Proposals for relaxing the powers of the attorney general.

This behaviour of Mr Beckford was by many of the court party censured in an extreme degree, as indecent, unprecedented, impudent, and little short of high treason; while, on the other hand, he was on the same account raised to the highest pinnacle of popular favour. He did not long, however, enjoy the applause of the people, dying within a short time after he made the celebrated speech above mentioned, and his death was reckoned an irreparable loss to the whole party. Several other petitions were presented on the subject of popular grievances; but the perpetual neglect with which they were treated at last brought that mode of application into disuse. A new subject of contention, however, now offered itself. The navy was in a bad condition, and the sailors every where avoided the service. Towards the end of August 16 ships of the line were ready to put to sea; but the legality of press warrants being questioned, the manning of them became a matter of great difficulty. The new lord Mayor, Brads Crosby, refused to back the warrants; which proved a vexatious matter to the ministry. They were further provoked by the unbounded liberty to which the press had been carried, and the mode of proceeding against some libellers had produced many complaints regarding the powers of the attorney general. He had filed informations and carried on prosecutions *ex officio*, without going through the forms observed in all other cases.—"This (it was said by the patriotic party) was inconsistent with the nature of a free government. No power can be more dangerous to private liberty, nor to the virtue or principles of him who enjoys it. The attorney acts under a minister, and his sense of duty must be very strong, or his independence very thoroughly secured by contentment, if

N^o 57.

he is at no time tempted to swerve from the laws of conscience and equity. It is in his power to give what name he pleases to a paper, and call it seditious or treasonable; then, without the interference of a jury, he proceeds to try the offender; who, though he may be acquitted, may nevertheless be ruined by the expences attending his justification." Examples were cited on this occasion of very flagrant oppression and injustice from this very power: the laws, it was said, were become changeable at the pleasure of a judge; and the liberty of the subject was taken from him, whenever he became obnoxious to his superiors. As these proceedings had therefore been the cause of very general complaint, a motion was made in the house of commons to bring in a bill for explaining and amending an act of the 4th and 5th of William and Mary to prevent invidious informations, and for the more easy reversal of outlawries in the court of king's bench. This motion was rejected by a great majority; the ministerial party urging, that the power of the attorney general was the same that ever it had been, and founded on common law. The abuse of power was no argument against the legal exercise of it; it was dangerous to overthrow established customs; the actions of the attorney-general were cognizable by parliament, which controul must for ever prevent a licentious exertion of his power, &c.

These arguments, however, even with the rejection of the motion, did not put an end to the disputes on this head. The courts of justice themselves were at this time held up in a very despicable light, on account of some late decisions which had been deemed contrary to law and usual practice. By these the judges had assumed a power of determining whether a paper was a libel or not; and the business of the jury was confined to the determination of the fact regarding its publication; and thus it was said to have appeared, that the judges had it in their power to punish a man who had been found guilty of publishing a paper, whether seditious or not. Lord Chatham, in a speech on the Middlesex election, took occasion to mention these abuses; and was answered by lord Mansfield, who looked upon himself to be particularly pointed at. The former, however, was so little convinced by his answer, that he drew from it an additional confirmation of his own arguments; and moved that a day should be appointed for taking into consideration the conduct of the judges; in which he was ably seconded by the late lord chancellor. A committee was accordingly moved for on December 6th 1770, to inquire into the matter; but, after much debate, was rejected by 184 to 76. The affair, however, did not yet seem to be terminated. Lord Mansfield gave notice next day, that on Monday he would communicate to the house of lords a matter of the utmost importance; but, when that day came, he produced nothing but a paper containing the case of Woodfall the printer as tried in the court of king's bench, that whoever pleased might read or take copies of it. This was looked upon as exceedingly frivolous, and greatly disappointed the expectations of the whole house. His lordship was asked, whether he meant that the paper should be entered on the journals of the house or not? To which he answered, that he had no such intention, but

but only that it should be left in the hands of the clerk: on which the affair would probably have been overlooked altogether, had not the late lord chancellor, who all along strongly supported the motion, stood up to accuse lord Mansfield, from the very paper to which he appealed, of a practice repugnant to the law of England. Hence he took occasion to propose some queries relative to the power of juries, and challenged his antagonist to a debate either at that time or soon after. But this method of proceeding was complained of as too precipitate, and an excuse was likewise made for not assigning a day for the debate at any other time; so that the matter soon sunk into oblivion. It was, however, loudly talked of without doors; and the judges, who had already fallen much in the estimation of the people, now became much more obnoxious. Pamphlets were printed containing the most severe accusations; comparisons were made betwixt some of the law lords and their predecessors, and even the print-shops were filled with ridiculous and satirical pictures.

house of
lords.

An accident which took place soon after contributed also greatly to lessen the character not only of the ministerial party, but even that of both houses of parliament taken collectively, in the eyes of the vulgar, to an extreme degree; and indeed it must be owned that nothing could be more derogatory to the honour of the first assembly of the nation, or to that of the individuals who composed it. A motion was made on the 10th of December 1770 by the duke of Manchester, that an address be presented to his majesty, that he would be graciously pleased to give orders for quickening our preparations for defence in the West Indies and in the Mediterranean; and particularly for securing the posts of Gibraltar and Minorca. But while his grace was descending on the negligence of ministry in leaving posts of such importance in a defenceless state, he was suddenly interrupted by lord Gower, who insisted on having the house immediately cleared of all but those who had a right to sit there. "When motions (said he) are thus brought in by surprise, and without the knowledge of the house as to their contents, it is impossible but such things may be spoken as are improper for the general ear; especially as the enemy may have spies in the house, in order to convey secret intelligence, and expose the nakedness of our possessions." His lordship was answered by the duke of Richmond, who complained of the interruption given to the duke of Manchester as a proceeding both irregular and insidious. This produced a considerable degree of altercation, and the cry of "Clear the house!" resounded from all quarters. Several members attempted to speak, but finding it impossible, and piqued at this shameful behaviour, 18 or 19 of them left the house in a body. The members of the house of commons then present were not only commanded to depart, but some of the lords went personally to the bar, and insisted on their leaving the house immediately. These unfortunate members alleged in excuse, that they attended with a bill, and were there in the discharge of their duty; but this availed nothing, they were peremptorily ordered to withdraw till their message should be delivered; and, after going through the usual forms, were turned out of doors amidst the greatest tumult and uproar.

roar. In the mean time the lords, who had just left the house of peers, had gone to the lower house, where they were listening to the debates, when the commons, who had been turned out of the house of lords, arrived full of indignation, and making loud complaints of the affront they had received. This was executed by turning out indiscriminately all the spectators; among whom were the 18 peers just mentioned, who were thus shut out from both houses. The affair terminated in a misunderstanding betwixt the two houses, which continued during the whole session. Sixteen lords joined in a protest, and in the warmest terms censured the treatment they had met with, as well as the unprecedented behaviour of administration, who had thus attempted to suppress the freedom of argument, and render the conduct of the house an object of censure and ridicule to the whole world.

Britain.

After the discussion of the affair of Falkland's island in the manner already related, a most unheard of instance of corruption was laid before parliament in the borough of New Shoreham in Suffex. The contest was occasioned by the returning officer, Mr Roberts, having returned a candidate with only 37 votes, when the other had 87; and, on bringing him to trial for this strange proceeding, the following scene of villany was laid open. A great number of the freemen of the borough had formed themselves into a society called the *Christian Society or Club*; but, instead of keeping up the character indicated by this title, it was clearly proved by the returning officer, who formerly belonged to it, that it was employed only for the purposes of venality. A select committee of the members were appointed to sell the borough to the highest bidder. The committee men never appeared at election themselves, but gave orders to the rest, and directed them how to vote; and, after the election was over, shared the profits among themselves. Though all this was clearly proved, the returning officer was dismissed with only a reprimand from the speaker of the house of commons, for having trespassed upon the forms to be sacredly observed by a returning officer. A more severe punishment, however, was reserved for the borough, and those wretches who had assumed the name of the *Christian Club*. A motion for an inquiry being carried unanimously, a bill was brought in to incapacitate 81 freemen of this borough, whose names were mentioned, from ever voting at parliamentary elections; and, for the more effectually preventing bribery and corruption, the attorney general was ordered to prosecute the committee belonging to the Christian club: the members were allowed counsel, and many different opinions were offered regarding the mode of punishment. Some were mercifully inclined only to reprimand them, while others proposed to disfranchise the borough; however, the bill for incapacitation was passed at length, though it did not receive the royal assent till the last day of the session.

of corruption
in New
Shoreham.

The unbounded licentiousness of the press now called the attention of parliament, though the evil appeared in a manner incapable of being checked. At this time neither rank nor character were any security against the voice of calumny from one party or other; and indeed it was hard to say on what side the most intemperate violence appeared. The ministry, how-

ever, provoked by a long course of opposition, made the loudest complaints of the freedoms taken with their names; while it was retorted by opposition, that the abuse from one quarter was as great as from the other. Some members of the house of commons complained that their speeches had been misrepresented in the papers, and endeavoured to put a stop to the practice of printing them. It was now considered as a matter contrary to the standing order of the house to print the speeches of the members of parliament at all; and a motion for calling two of the principal printers to account was carried by a considerable majority. The printers, however, did not attend the summons of the messenger; and a final order for their appearance was directed to be left at their houses, and declared to be sufficient notice when left at their houses. The disobedience of the printers on this occasion was undoubtedly heightened by the favour they hoped to obtain from the popular party; and indeed it was not without the most severe animadversions that the ministry were able to carry their motions against them. This opposition increased by its being farther moved that they should be taken into custody by the serjeant at arms for contempt of the orders of the house. The temper and disposition of the people towards the house was now objected, and the great impropriety of adding to their alarms by any unnecessary stretch of the executive power; but the majority urged the necessity of preserving the dignity of the house, and putting an end to those offensive freedoms which had been taken with its members. The serjeant at arms next complained, that not being able to meet with the printers at their houses, he had been treated with indignity by their servants; on which a royal proclamation was issued for apprehending Wheble and Thomson, the two obnoxious printers, with a reward of L.50 annexed. But in the mean time six other printers, who had rendered themselves equally obnoxious on a similar account, were ordered to attend the house, though the motion was not carried without great opposition, during which time the house divided between 20 and 30 times. Some of the delinquents were reprimanded at the bar, and one who did not attend was ordered to be taken into custody for contempt. Wheble being apprehended in consequence of the proclamation, was carried before Mr Alderman Wilkes, by whom he was discharged. To this magilliate it appeared that Mr Wheble had been apprehended in direct violation of his rights as an Englishman, as well as of the chartered privileges of a citizen of London; which opinion he declared in a letter to the earl of Halifax, one of the secretaries of state. Thomson was discharged in the same manner; but the captors received certificates from the magistrates, in order to obtain the promised rewards. J. Miller, one of the six who had refused to attend, was taken into custody from his own house by the messenger of the house of commons. On this he sent for a constable, and was carried along with the messenger before the lord mayor, and aldermen Wilkes and Oliver at the mansion house. The lord mayor refused to deliver up the printer and messenger at the request of the serjeant at arms; and after some disputes the messenger was committed to prison, as he had been accused by Miller of assault and false imprisonment, and

the serjeant had refused to find bail; however, he was immediately released upon the bail being given.

By this affront, not only the majority, but many of the popular party also were greatly irritated: however, the members in opposition took care to lay all the blame on the absurd conduct of administration with regard to the Middlesex election; in consequence of which they had incurred such a general odium, that the people thwarted every measure proposed by them, and eluded and despised their power on every occasion. The lord mayor was ordered to attend the house next day; at which time he pleaded that he had acted in no manner of way inconsistent with the duties of his office; as, by an oath which he took when entering upon it, he was bound to preserve the franchises of the city, and his conduct was farther to be vindicated from the terms of the city charters, as recognised by act of parliament. It was then moved that he should be allowed counsel; the question appearing to belong to the lawyers, as his lordship did not pretend to deny the privileges of the house, though he contended for an exemption from that privilege by virtue of charters and an act of parliament. This motion, however, was over-ruled, it being insisted that no counsel could ever be permitted against the privileges of the house. This refusal of counsel took its rise from a transaction in the reign of Henry VIII. and was now pleaded as the custom of parliament. Some proposed that the lord mayor should be heard by counsel, provided the privilege of the house was not affected; but it was considered as absurd to the last degree that his lordship should be heard by counsel on every point except the very one in question. At the same time a motion was carried, that the lord mayor's clerk should attend with the book of minutes; and notwithstanding all opposition, he was obliged to expunge out of it the recognizance of Whittam the messenger. This was followed by a resolution that there should be no more proceedings at law in the case; a great altercation ensued, and several of the minority at last left the house in the utmost rage.

Though it was now one o'clock in the morning, the ministerial party were so ardent in the prosecution of their victory, that they refused to adjourn; proceeding now to the trial of Mr Oliver, who, as well as the lord mayor, was far from expressing any sorrow for what he had done. Some proposed to censure his conduct, others were for expulsion; but when it was proposed to send him to the Tower, the utmost confusion and mutual reproach took place; some members declared that they would accompany him to the place of his confinement; others left the house, while ministry used their utmost endeavours to persuade him into some kind of apology or concession for what he had done; but finding that to no purpose, they at last carried the motion for his imprisonment, and he was committed accordingly. Ample amends, however, were made for this punishment by the unbounded popular applause heaped on both the lord mayor and alderman on this occasion, and which indeed threatened very serious consequences. Some days after the commitment of Mr Oliver, when the lord mayor attended at the house of commons, several very alarming insults were offered to many of the members, particularly

lately laid North; who, on this occasion, lost his hat, and narrowly escaped with his life. Some of the members of the minority interposed, and expostulated with the mob on the impropriety of their conduct, by which means all further disturbance was prevented; and had it not been for this timely interference, it is supposed that the fray would not have ended without much bloodshed.

After the confusion was in some measure dispersed, the debates concerning the lord mayor again took place. Many arguments were brought against proceeding farther in the matter; but being disregarded, the minority members left the house. His lordship refused the favour offered him of being committed to the custody of the serjeant at arms, upon which it was resolved to commit him to the Tower; the motion for this purpose being carried by 200 against 39. Mr Wilkes, on being ordered to attend, wrote a letter addressed to the speaker of the house, in which he observed, that no mention had been made of his being a member; and that if his seat in parliament, to which he had been duly elected, was to be granted him, he would attend and justify his conduct. Administrators, however, were too wise now to encounter this here, and at the same time were under no little embarrassment how to get off; so at last they were reduced to the miserable shift of ordering him to attend on the 8th of April 1771, at the same time that they adjourned the house to the 9th.

The many affronts and indignities which administration had of late been obliged to put up with now rendered it absolutely necessary to fall upon some method to show that their authority was not altogether lost. For this purpose a committee was appointed by ballot to inquire into the reason why there had been so many obstructions to the authority of the house of commons. This committee having sat from the 28th of March to the 30th of April, at last gave in the following report. "Your committee beg leave to observe, that in the diligent search they have made in the journals, they have not been able to find an instance that any court or magistrate has presumed to commit, during the sitting of parliament, an officer of the house for executing the orders of the house. They further beg leave to observe, that they have not been able to find, that there ever has been an instance wherein this house has suffered any person, committed by order of this house, to be discharged, during the same sessions, by any authority whatever, without again committing such persons. As therefore, with regard to J. Millar, who was delivered from the custody of the messenger by the lord mayor, who, for the said offence, is now under the censure of the house, it appears to your committee, that it highly concerns the dignity and power of the house to maintain its authority in this instance, by retaking the said J. Millar, the committee recommend to the consideration of the house, whether it may not be expedient, that the house should order that the said J. Millar should be again taken into custody of the serjeant at arms; and that his deputy or deputies be shortly enjoined to call upon the magistrates, officers of the peace, and other persons, who by the speaker's warrant are required to be aiding and assisting to him in the execution thereof, for such assistance as the said serjeant, his deputy or deputies,

shall find necessary, to enable him or them to take into custody the said J. Millar."

Nothing could have been more proper than the urging with such violence a course of such a nature, as was to be expected; and in which they were really to be applauded. What they intimated for punishment they afforded the criminals matter of triumph and exultation. Every honour that the city of London could bestow was conferred upon the magistrates, whose complaints and execrations of the people at large became louder than ever. Every step taken about this time by administration seemed calculated to do the public ill honour. Towards the end of the session a bill was brought in "for enabling certain persons to inclose and embank part of the river Thames, and situate to Durham-yard, Salisbury-street, Cecil-street, and Beaufort-buildings, in the county of Middlesex." This bill was opposed, as appearing contrary to the ancient rights and privileges of the city of London; but was easily carried through both houses, though it produced a protest in the upper house; and a few days before the rising of the session, the city of London petitioned against it. In this petition it was complained of as a violent and unjust transaction, totally unprejudicial, being an invasion of the property which the city claimed in the soil or bed of the river. It was afterwards complained of in a remonstrance, as an infringement of the rights of the people, and urged as a reason for the dissolution of parliament.

The only other transaction of moment during this session related to the East India company. It was now proposed to raise 2000 men in England for the service of the company, the officers to be appointed by the king, and to be paid by the company. But after much speculation, it was rejected as unconstitutional and dangerous to keep an armed force in the kingdom which was not paid by government; and that, however inconsiderable the number proposed was at present, it might soon be increased on any frivolous pretence. It was likewise urged, that it would prove an objection to the recruiting service for our own army, on account of the superior advantages of enlisting in the company's service. The advocates for the bill urged the inconvenience of sending out a sufficient number of men annually to recruit the Indian forces; and that, unless parliament should adhere to the promise they formerly made of assisting the company in recruiting, they would be daily exposed to vast loss and expence from the tricks of recruiting parties. The session rose on the 8th of May. In the speech from the throne, it was observed, that the satisfaction obtained from his Catholic majesty for the injury done to this kingdom, and the proofs of the genuine disposition which the courts of France and Spain had given by laying aside their armaments, enabled us to reduce our forces by sea and land. The zeal manifested by parliament could not fail to convince the world of its sincere attachment to the crown and to the interest of the country. His majesty's edicts and decrees intended to put an end to the troubles which still prevailed in some parts of the continent; they were also to the commons for the recovery, abolition, and public spirit with which they had granted the supplies; and an apology was made for the extraordinary demands which had been made. The speech concluded with

East India affairs considered.

advising the members to use their best endeavours, in their respective stations and counties, to render the national happiness complete, by discouraging needless suspicions and domestic disturbances. His majesty had no other object, and could have no other interest, than to reign in the hearts of a free and happy people; and it was his earnest wish that his subjects might not be prevented, by mistakes or animosities among themselves, from enjoying the happiness they had in their power.

r28
Popular
party dis-
couraged.

The many defects that had been received by opposition during this and the foregoing sessions, now began to discourage them from proceeding such lengths in the cause of patriotism as they had formerly done. Many of them had also lost much of their popularity by taking an active part against the printers; and as every motion had been carried in favour of administration by nearly two to one, a general discouragement and languor began to take place among the popular party. The only gainers indeed by the late contentions were the city magistrates and printers who had been punished by the house of commons. On the rising of the parliament, when the lord mayor and aldermen were released from the tower, they were welcomed by every mark of congratulation. The city was illuminated; and the mob, as usual, took vengeance on the refractory by breaking their windows. A committee was even appointed to carry on a prosecution against the speaker of the house of commons; but as this did not seem likely to afford any redress, they determined once more to have recourse to the throne. Accordingly, on the 10th of July 1771, another petition and remonstrance was presented, the subjects of which were the embankment on the Thames, the proceedings against the magistrates, and a speedy dissolution of parliament was requested. But this met with as unfavourable an answer as before. His majesty replied, that he was ready to put an end to the real grievances of his faithful subjects; but was sorry to find that a part of them still renewed requests which he had repeatedly refused to comply with.

In the speech from the throne, when the parliament met, January 21st 1772, his majesty observed, that the performance of the king of Spain's engagements, and the behaviour of the other European powers, promised a continuance of peace; and though the necessity of keeping up a respectable naval force was evident, yet no extraordinary aid for that purpose would be necessary; and he concluded with recommending the most vigilant and active attention to the concerns of the country, with an assurance of the interposition of the crown to remedy abuses or supply defects. Little dispute was made about the addresses in answer to this speech, though an ample subject of altercation very soon occurred. This was a motion made by administration, intimating the necessity of raising 25,000 seamen for the service of the current year; it being always necessary, they said, for us to preserve a superiority to the French in the East Indies, which had not been the case since they sent a considerable fleet thither. "It was equally necessary (they added) to preserve the present strength of the West Indies unimpaired; as the Spaniards knew the importance of our settlements there too well not to make an attack upon them first if ever a rupture should take place. Twenty of the best ships in the navy were also now employed as guard-

r29
Debates on

mentation
of the num-
ber of sea-
men.

ships, and wanted nothing but men to fit them for actual service."

Britain.

A declaration of this kind, coming immediately after the assurances of peace that had been given from the throne, was said to be a contradiction; that the peace-establishment would thus be augmented till we were overburdened by it; 500,000*l.* would thus be added to the national expences; and as the same augmentation might every year be made on similar pretences, we should thus be obliged to submit to the hardships of war in time of a profound peace. If the assurances of peace from the throne were well founded, the force in the East Indies was already too great; if, on the contrary, a war was at hand, it would be too small notwithstanding the proposed augmentation; and the same way Jamaica was likely to suffer from the inferiority.

These remonstrances were by no means sufficient to put a stop to any measure which had at this time been suggested by administration. The question for the augmentation was carried without a division: after which the subject of religion came to be discussed. This was occasioned by the general tendency to Arianism or Socinianism, which had for some time prevailed to a great degree, and had at last infected the established church in such a manner, that the subscription to her standards was reckoned intolerable by many of the clergy. Meetings had been frequently held by the discontented members, in order to consider of some mode of relief; and in the beginning of February 1772, about 250 of them, with several professors of law and physic, joined in a petition to the house of commons, expressing their dissatisfaction with subscription to any human forms, and praying for relief. In this petition they asserted, that they held certain rights and privileges from God alone, without being subject to any other authority; such as the exercise of their own reason and judgment, by which they were instructed and confirmed in their belief of the Christian religion, as contained in the holy scriptures. They accounted it a blessing to live under a government which maintained the sufficiency of the scriptures to instruct in all things necessary to salvation. Hence they concluded, that they had a right from nature, as well as from the principles of the reformed religion, to judge for themselves what was or was not contained in the scriptures. From this invaluable privilege, however, they found themselves in a great measure precluded by the laws relative to subscription; by which they were enjoined to acknowledge certain articles and confessions of faith framed by fallible men as entirely agreeable to scripture. They prayed therefore to be relieved from such an imposition, and to be restored to their undoubted right of interpreting scripture for themselves, without being bound by any human explanation of it, or being required to acknowledge by subscription or declaration the truth of any formulary of religious faith and doctrine whatever excepting the holy scripture itself.

530

articles.

The affair of subscription they looked upon to be not only a grievance to themselves, but an encroachment on their rights as men and members of a Protestant establishment, as well as a great hindrance to the spreading of the Christian religion, tending to discourage further inquiry into the true sense of scripture, to divide communions, and to cause a mutual dislike

Britain. dislike betwixt fellow Protestants; giving occasion for unbelievers to reproach and vilify the clergy, by representing them as guilty of prevarication, and of accommodating their faith to lucrative views and political considerations. It afforded also to Papists and others disaffected to the religious establishment of the church of England, an occasion of reflecting upon it as inconsistent, and authorising doubtful and precarious doctrines, at the same time that the scripture alone was acknowledged to be certain and sufficient for salvation. It had likewise a tendency to divide the clergy among themselves; subjecting one part, who asserted their privilege as Protestants, to be reviled, both from the pulpit and the press, by another who seemed to judge the articles they had subscribed to be of equal authority with the scripture itself; and lastly, it occasioned scruples and embarrassments of conscience to those who were about to enter into the ministry, or prevented the cheerful exercise of it to those who were already entered. By reason of these embarrassments the clerical part of the petitioners found themselves under great difficulties, being obliged in some sense to join with the adversaries of revelation, in supposing the one true sense of scripture to be expressed in the present established system of faith; or else to incur the reproach of having deserted their subscription, &c. while such of the petitioners as had been educated with a view to the professions of civil law and physic could not but think it a great hardship to be obliged, as they all were in one of the universities, even at their first matriculation and admission, though at an age very improper for such important disquisitions, to subscribe their assent to a variety of theological tenets, concerning which their private opinions could be of no consequence to the public, in order to intitle them to academical degrees in those faculties; more especially as the course of their studies and attention to their practice did not afford them leisure sufficient to examine how far these tenets were consonant to the word of God.

This petition was presented by Sir William Meredith, who, along with the other members who favoured the cause, enforced it by many arguments drawn from the principles of toleration. They maintained also that nothing but hypocrisy and prevarication could arise from obliging men to subscribe what they did not believe; that the repeal of the laws for subscription would prevent the increase of dissenters, so very conspicuous at this time, and incline many of them to return to the church. The articles themselves were said to have been compiled in a hurry; that they contained doctrines highly controvertible; and that this restraint on the consciences of men was of all others the greatest hardship. The majority of parliament, however, were found inimical to the petition, though some, who opposed it at present, wished for time to consider it more deliberately, or to refer it to a committee of the clergy. By the rest it was urged, that the matter of the petition was a violent infraction of the laws of the English religion; and that, if this was granted, another would soon follow against the liturgy. The conduct of many of the petitioners, instead of being founded in any regard for religion, had its origin in hypocrisy and dissoluteness, and certainly proceeded in many instances from a disbelief of the

Trinity, and of the divinity of our Saviour. The complaints of men were to be disregarded when they wished to profit by the emoluments of the church without subscribing to its laws; besides, the king was bound by his coronation oath to maintain the church-government without a variation. It was likewise contended, that if people were to be restrained by no other article than an assent to the truth of the scriptures, the church would soon be over-run with impiety. Many had already founded blasphemous tenets on the right of private opinion; and though it could not be denied that every man has this right for himself, yet none has a right to obtrude his singularities upon others; and if any of the clergy found the delicacy of their consciences affected after they had accepted of benefices, they were welcome to leave them.

Some of the more moderate opposers of the petition endeavoured to vindicate the character of the clergy from the imputations laid upon them, and contended that the legislature had a controuling power over the articles of the union, and confirmed their assertion by mentioning the act against occasional conformity, as well as another against elective patronages, both of them passed since the union; and it seemed to be the general wish of the house that the professors of law and physic might be relieved from subscription, though they did not consider their share in the matter as of any great importance to the public. It was at last thrown out by a majority of near 150.

The rejection of the subscription bill was followed by that of a bill for quitting the possessions of his majesty's subjects from dormant claims of the church; after which the attention of parliament was called to one of the utmost importance, and which was introduced by a message from the king. This was the famous royal marriage bill, occasioned by the marriage of the duke of Cumberland with Mrs Horton, a widow lady, daughter of lord Inham and sister to colonel Luttrell, and that of the duke of Gloucester with the countess-dowager of Waldegrave. By the message it was recommended to both houses to take it into their consideration, whether it might not be expedient to supply the defect of the laws then in being, and by some new regulations more effectually to prevent the descendants of his late majesty (excepting the issue of the princesses who had married, or might hereafter marry into foreign families) from marrying without the consent of his majesty, his heirs, and successors. In consequence of this a bill was brought in, declaring all such marriages, without the consent above mentioned, to be null and void. The descendants of his majesty, however, if above the age of 25 years, might marry without the royal consent, provided they gave intimation a twelve-month before hand, to the privy council, and no opposition to the match was made by parliament during that interval.

This bill met with the most violent and powerful opposition. The principal arguments against it were expressed in two protests from the upper house, and were to the following purpose: 1. The doctrine that marriages in the royal family are of the highest importance to the state, and that therefore the kings of this realm have ever been trusted with the care thereof, is both absurd and unconstitutional; though it would from that period have the force of a parliamentary declaration.

Britain.

claration. The immediate tendency of this was to create as many prerogatives to the crown as there are matters of importance in the state; and to extend them in a manner as vague and exceptionable as had ever been done in the most despotic periods. 2. The enacting part of the bill had an inconvenient and impolitic extent; namely, to all the descendants of Geo. II. In process of time, that description might become very general, and comprehend a great number of people; and it was apprehended that it would be an intolerable grievance for the marriages of so many subjects, perhaps dispersed among the various ranks of civil life, to be subject to the restrictions of this act, especially as the abettors of this doctrine had also maintained, that the care and approbation of the marriage also included the education and custody of the person. This extensive power might in time make many of the first families of the kingdom entirely dependent on the crown; and it was regretted that all endeavours to limit, in some degree, the generality of that description, had proved ineffectual. 3. The time of nonage for the royal family appeared to be improperly extended beyond the limit of 21 years; a period which the wisdom of the constitution seems, with great wisdom, to have assigned to minority. 4. The deferring their marriage to the age of 26 might also be attended with other bad consequences, by driving them into a disorderly course of life, which ought to be particularly guarded against in those of such an exalted station. 5. The power given by this bill to a prince to marry after the age of 26, is totally defeated by the proviso which declares the consent of parliament to be ultimately necessary. Thus great difficulties must be laid on future parliaments, as their silence, in such a case, must imply a disapprobation of the king's refusal; and their concurrence with it might prove a perpetual prohibition from marriage to the party concerned. 6. The right of conferring a discretionary power of prohibiting all marriages, appears to be above the reach of any legislature whatever, as being contrary to the inherent rights of human nature; which, as they are not derived from, or held under, the sanction of any civil laws, cannot be taken away by them in any case whatever. The legislature no doubt has a right to prescribe rules to marriage as well as to every other kind of contract; but there is an essential difference between regulating the mode by which a right may be enjoyed, and establishing a principle which may tend entirely to annihilate that right. To disable a man during life from contracting marriage, or, which is the same thing, to make his power of contracting such marriage dependent neither on his own choice nor on any fixed rule of law, but on the arbitrary pleasure of any man, or set of men, is exceeding the power permitted by divine providence to human legislature, and directly contrary not only to the divine command, but also to the rights of domestic society and comfort, &c. 7. This bill has a natural tendency to produce a disputed title to the crown. If those who are affected by it are in power, they will easily procure a repeal of this act, and the confirmation of a marriage made contrary to it; and if they are not, it will at least be the source of the most dangerous faction that can exist in any country, viz. one attached to the pretender to the crown; whose claim, he may assert, has been set aside by no other

authority than that of an act to which the legislature was not competent, as being contrary to the common rights of mankind. 8. The bill provides no security against the improper marriages of princesses married into foreign families, and those of their issue; which may full as materially affect the interest of this nation as the marriages of princes residing in the dominions of Great Britain. It provides no remedy against the improper marriage of the king reigning, though evidently the most important of all others to the public. It provides nothing against the indiscreet marriage of a prince of the blood, being regent at the age of 21; nor furnishes any remedy against his permitting such marriages to others of the blood-royal, being fully invested with the regal power for this purpose, without the assistance of council.

The answer to all these arguments was, that the inconveniences so much talked of were merely imaginary; and if the king should make any improper use of his authority, parliament had it either in their power to prevent the effect, or to punish the minister who advised it. The crown, it was said, was dishonoured by improper connections, and many of the greatest national calamities have proceeded from improper alliances between the royal family and subjects; and that if, from after experience, we should find any material grievances ensue from this act, it could as easily be repealed at that time as thrown out now, and on better grounds. It was very rapidly carried through both houses; in the upper house by 92 to 26; and in the lower by 165 to 115.

Though the late decision concerning subscription to the 39 articles did not seem to promise much success to any innovations in religious matters, yet the ease of dissenting ministers was introduced soon after the discussion of the royal marriage act; the advocates for it being encouraged to bring it forward chiefly on account of some favourable hints thrown out in the debates on the subscription-bill. A petition was now presented by a great body of these people, praying to be relieved from the hardship of subscribing to the articles of a church to which they did not belong. This, however, was most violently opposed by the opponents of the former bill, though with very little success in the house of commons, where it was carried through by a prodigious majority. Here it was maintained that nothing can advance the true interest of religion so much as toleration; and if articles of subscription are necessary, it must only be for men destitute of principle, and who would, in compliance with ambition or avarice, as readily subscribe to one set of articles as another. If thus any of the fundamental doctrines of Christianity are impugned, there are abundance of laws in existence to correct the impiety. The dissenters have indeed altered some of their original forms and doctrines, but that only in matters of indifference. It is the effect of learning, leisure, and refinement, to give men many opportunities of altering established forms. This has been the case formerly, and always will be. The dissenters have long been virtually exempted from this subscription; and yet the piety and decency of many of them, particularly in Scotland and Ireland, where no such laws are in being, sufficiently show, that men, whose minds are steadfast in the purity of religion, will not be confined nor influenced by laws

Britain.

534
Bill for the relief of dissenters proposed.

Britain. laws of human invention. But though the dissenters enjoy full liberty by connivance at present, where is their security against the sudden attacks of malice and envy, which may be backed by the sanction of law? Every neglect of a law by connivance is an additional proof of the necessity of abrogating that law; and liberty is but an empty name, where it is enjoyed by an oversight only, as it were, of our superiors. In the house of lords, however, the bill was rejected by a majority of 70. Here the doctrine of universal toleration was strenuously opposed, as well as the great danger set forth, to which the church of England would be exposed by departing from the laws which guarded its privileges. The dissenters, it was said, had great cause to be satisfied with the favour they enjoyed by connivance; and the laws were only kept on record as a necessary curb, left in the degeneracy of a declining kingdom, religion should be destitute of protection against heresy and blasphemy.

535
ced.

The only other affairs of this session were some attempts at an inquiry into the affairs of the East India company, which were now in a very critical situation. These, however, did not come under consideration till the next session which took place November 26th 1772, when his majesty gave this situation of the affairs of the company as a reason why he had called them together sooner than usual. The continuance of the pacific disposition of other powers was mentioned, and satisfaction expressed that the continuance of peace had afforded an opportunity of reducing the naval establishment, though a great force is always be necessary for the defence of these kingdoms. Oeconomy was promised with regard to the supplies, and it was recommended to take every method that could be devised to remedy the dearth of provisions.

536
India
irs.

The affairs of the East India company took up the greatest part of the present session. It had been projected, as far back as the year 1767, when they were in a very flourishing condition, to bring them under the inspection of government, that the nation might share the immense wealth supposed to be enjoyed by the company. The design, however, did not succeed at that time, nor would it probably have been easily brought to bear, had not the affairs of the company been embarrassed by the bad conduct of their servants. During the last session a bill had been brought in for restraining the governor and council from all kind of trade, as well as for enlarging the power of the company over its servants. The bill, however, was rejected after the second reading, and indeed was thought to have been proposed only to introduce the succeeding business. The debates on the subject procured in a great measure the general belief of two points of much importance to the success of the scheme, viz. that the affairs of the East India company were in a very bad situation, owing to the behaviour of its servants; and that the company was at any rate insufficient for the government of such extensive possessions; of consequence that there was an evident necessity of giving up the management of it to the crown. A motion was now made in parliament, by a gentleman unconnected with administration, for a select committee to inquire into the affairs of the company: but many reasons were urged against this appointment, particularly that the station was too far advanced for a business of

such importance; that the committee, being a secret one, was not accountable for its conduct; and that, as the minister would have it in his power to nominate the members of the committee, considerable partiality might on that account take place. The motion, however, was carried without a division; and the members were chosen by ballot.

The affairs of the East India company proceeded from bad to worse during the recess. The treasury at home was quite exhausted; while bills to a vast amount, drawn on Bengal, were nearly due; which, with their debt to the bank and other public offices, along with the sum to be paid to government, reduced them almost to the brink of bankruptcy. They were therefore reduced to the expedient of borrowing a sum of money from administration; but their application was received with great indifference. The minister desired them to apply to parliament. The reports of the select committee, in the mean time, contrary to the promise of secrecy, were published, and gave the public no favourable opinion of the behaviour of the company's servants. On the meeting of parliament, the minister moved for another committee, under the title of the *committee of secrecy*, to consist of 13 persons, for taking into consideration the state of the company's affairs; which might thus undergo a full investigation, without any thing being known to the world, which had excited such indignation in the former case. The members of this new committee were also to be chosen by ballot; so that no objection could militate against them that did not militate, with equal strength, against the whole house. It was objected, that this mode of secret inquiry, by a small number, was unprecedented and unconstitutional; that the members would in effect be nominated by the minister, and act under his direction; and that a free investigation by the whole parliament was essentially different from that by a secret committee. In the latter case, every information that the minister thought proper to conceal would be withheld: at any rate, a committee of secrecy is an evident absurdity; a committee can be no longer a secret than during the time it takes up for inquiry. Its proceedings must be laid before the public; and in case of unjust accounts, the parliament had no means of being undeceived. These reasons, however, were of no avail at present. The committee of secrecy was carried, as the other had been, without a division; and, as had been predicted, the members, though chosen by ballot, were almost all of them devoted to administration. The select committee was likewise revived, that they might be, as it was said, checks upon one another; so that between them the nation would have every requisite degree of information on the whole affair.

775

In a very short time after the appointment of the secret committee, a report was given in, stating that the East India company were in great distress for want of money; and that as this was the case, a bill ought to be brought in for restraining them from sending out superfluous to India, a scheme which they had meditated at that time. The minister and his adherents enlarged greatly on the necessity of this bill; which, they said, was by no means a great and glorious company, it was absolutely necessary for this purpose not to allow it to enlarge its extensive commerce, at a time when their affairs were by

Britain.

much embarrassed that they were obliged to apply to government for a loan. It was even doubted whether the company, without the sanction of parliamentary authority, had power to appoint a commission of this kind. On the other hand, the minister's proposal was said by opposition to be unconditional and insidious. The want of cash at present experienced by the East India company was not of such great importance, their credit being then as fully established as ever. They had made choice of a set of men in whom they could confide; the many losses occasioned by their servants rendered the commission indispensably necessary; and the expence would be paid from the savings which must undoubtedly arise from so prudent a step. It was unreasonable, because the East India company, or any other, are distressed, to allow them no opportunities of extricating themselves. The company could not be said to want respect for parliament; they had shewed this already by delaying the departure of the commission till the inquiry begun by the house was finished: nor could they be wanting in respect to their own interest, charter, and constitution; which they seemed to show by every possible mark of opposition to this bill. Administration boasted of their intentions and their wishes to render this company great and glorious; but how could we expect greatness or glory to proceed from a quarter where it did not exist? The dignity of parliament was lessened, and its glory effaced, by the conduct of ministers, and the many wanton acts of authority lately committed. It was a curious method of rendering a company great and glorious to plunder the proprietors of immense sums of money by exorbitant grants, or by taking away their charters; for, after this act, it was plain that charters could no longer be depended upon. Two gentlemen belonging to the company, and then present in the house, offered to pledge themselves, that the commission of supervision should not be allowed to depart until, from further reports, a full knowledge of the company's affairs should be acquired. This, however, was instantly rejected, it being said to be defective in security: that the East India company would not scruple to make an agreement of this kind to-day, and break it to-morrow; which could only be prevented by an act of parliament, especially as the ministry had no motives for promoting this measure, but a regard for the welfare of the company, and a desire to restore its affairs to a better state.

538
Ineffectual
attempts of
the compa-
ny to pre-
vent the
passing of
the bill.

Notwithstanding all the arguments used by administration in favour of this bill, however, the company were so far from thinking it to their advantage, that they used every endeavour to prevent its passing into a law. They petitioned; and some of their servants were examined in the house of commons in order to show the necessity of supervisors being sent out, who might be qualified to reduce their affairs to some order by being on the spot, and enabled to curb the excesses of which the company's servants had too frequently been guilty. During this examination it appeared, that from the year 1765 to 1773 the expences of the company had increased from 700,000l. to 1,700,000l. annually, and that government had received near two millions from the company every year; that they had immense profits in extraordinaries, while the proprietors lost considerably of the dividend which

1757.

the profits of their trade alone would have produced. In spite of all opposition, however, the bill for restraining the company from sending out any commission of supervision was carried by a majority of 153 to 28. In the house of lords it met with similar success, being carried by 26 to 6, though the minority thought proper to enter a protest. The reasons given against it in this protest were, that it took away from a great body corporate, and from several free subjects of this realm, the exercise of a legal franchise, without any legal cause of forfeiture assigned. The persons appointing the commissioners had by law a right to elect, and the persons chosen had a legal capacity of being elected. The supervisors had a full right vested in them agreeable to the powers and conditions of their appointment; but though no abuse was suggested nor any delinquency charged upon them, these legal rights and capacities were taken away by a mere arbitrary act of power, the precedent for which leaves no sort of security to the subject for his liberties. The bill seemed likewise a manifest violation of the public faith. The charter of the East India company was granted by the crown, authorized by act of parliament, and purchased for valuable considerations of money lent and paid. By this the company were allowed to manage their own affairs as they thought proper, and by persons of their own appointment; but by this bill the exercise of the power just mentioned was suspended for a time, and by grounding the supervision upon the actual interference of parliament with the affairs of the company, established a principle which might be used for perpetuating the restraint to an indefinite length of time. It is indeed difficult to settle the legal boundary of legislative power, but it is evident, that parliament is as much bound as any individual to observe its own compacts; otherwise it is impossible to understand what is meant by public faith, or how public credit can subsist. It appeared by evidence upon oath at the bar of the house of lords, that the company had received assurances from their chairman and deputy chairman, that the appointment of a commission for superintending and regulating their affairs would be approved by administration; and it was extremely hard that they should be able to find no security for their charter privileges against these very ministers, under whose sanction they had reason to believe they were all along acting. It was also the more incumbent on the company at present to give the most strict attention to their affairs, to enable them to answer the exorbitant demands of government, as it appeared, from the witnesses at the bar, that its exactions amounted to more than the whole profits of the late acquisitions, and the trade ensuing from them; while the proprietors, who had spent so much, and so often risked their all for obtaining these acquisitions, had not been permitted even to divide so much as the profits of their former trade would have afforded.

The secret committee now gave in their second report, containing a statement of the debt, credit, and effects of the company in England; beginning with an account of the cash in the company's treasury on the 1st day of December 1772, and containing a statement of all their debts and claims against them in every part of the world. Thus it appeared that the cash, credit,

The statement, however, was complained of as unfair; and it was said, that impartiality was not to be expected from a set of men who had it in their power to make what report they pleased for the interest of government measures: but the members protested their innocence; and administration insisted, that, until proof could be brought that the statement was unfair, the house was bound to adhere to it as just.

application
of the com-
pany to go-
vernment
for a loan.
The business was revived after the holidays by an application from the company to government for a loan of L. 1,500,000 for four years, at 4 per cent. interest, with liberty of repaying the same according to the abilities of the company, in payments of not less than L. 300,000; and that the company should not make a dividend of more than 6 per cent. until the loan should be reduced to L. 750,000; that then they might raise their dividend to 8 per cent. and after the whole loan was discharged, that the surplus of the nett profits arising in England, above the said dividend, should be appropriated to the payment of the company's bond debt, until it was reduced to L. 1,500,000, when the surplus profits should be equally divided between the public and the company. It was also requested, that the company should be released from the heavy penal interest incurred by the non-payment of money owing in consequence of the late acts for the indemnity on teas; and that they should be discharged from the annual payment of the L. 400,000 to the public for the remainder of the five years specified in the agreement. They farther requested, that the accounts of the Duanee revenues, of the charges of collection, expences of Bengal, company's accounts of sales, &c. should be delivered annually to parliament, and that leave might be given to export teas free of all duty to America, and to foreign parts. This request was judged expedient to be granted, and the following resolutions were agreed to, "That the affairs of the East-India company are in such a state as to require the assistance of parliament; that a loan is necessary to regulate the company's affairs; that the supply be granted; and that care be taken that the company be prevented from experiencing the like exigencies for the future. The two following motions were also founded upon the report of the secret committee, viz. That, supposing the public should advance a loan to the East-India company, it was the opinion of the committee that the dividend should be restrained to 6 per cent. until the payment of the sum advanced; and that the company be allowed to divide no more than 7 per cent. until their bond-debt be reduced to L. 1,500,000.

544
resolutions
of admini-
stration in
consequence
These severe restrictions were judged proper by administration for the security of the public, and were such, they said, as every creditor has a right to make before hand with a person who wishes to borrow money from him. The company, however, replied, that these restrictions were contrary to the proposals they had made, and void of foundation, as being built on the erroneous reports of the secret committee. The chairman of the company declared at a general court that the government had agreed, or would agree, to the

Territorial
right of the
company to
their posses-
sions ac-
quired.
The next step was to deprive the company of their territorial right to the countries they possessed in the East Indies. This had been allowed them in the most explicit manner, as appears by some of the papers which passed between the French and English ministers during the negotiations for the treaty of Paris: from one of which papers the following is an extract: "Respecting those territorial acquisition, which the English East India company have made in Asia, every dispute relative thereto must be settled by that company itself, the crown of England having no right to interfere in what is allowed to be the legal and exclusive property of a body corporate belonging to the English nation." This territorial right, however, was now denied. After reading the company's petition, lord North told the house that it was the opinion of several great lawyers, that such territorial possessions as the subjects of any state shall acquire by conquest, are virtually the property of the state, and not of those individuals who acquire them. It was his opinion, however, that it would be more beneficial to the public and to the East India company, to let the territorial acquisitions remain in the possession of the company for a limited time not exceeding six years, to commence from the agreement betwixt the public and the company. At the same time it was moved, that no participation of profits should take place betwixt the public and the company until after the repayment of L. 1,400,000 advanced to the company; and the reduction of the company's bond debt to L. 1,500,000. That after the payment of the loan advanced to the company, and the reduction of their bond-debts to the sum specified, three fourths of the nett surplus profits of the company at home, above the sum of 8 per cent. upon their capital stock, should be paid into the exchequer, for the use of the public, and the remaining fourth be set apart either for reducing the company's bond-debt, or for composing a fund for the discharging of any contingent exigencies the company might labour under.

547

pany's peti-
tion con-
sidered.
These proceedings were exceedingly disagreeable to the company. They now presented a petition complaining of the injustice of demanding any farther terms on account of a loan, after that loan was discharged. The limitations of the company's dividend to 7 per cent. after the discharge of the loan, until their bond-debt should be reduced to L. 1,500,000, seemed not to be founded upon any just calculation of their commercial profits; nor could it with reason be alleged that it was necessary either to their credit or that of the public to restrain them in such a manner. The additional dividend of 1 per cent. was an object of some consequence to the proprietors, but very little to the discharge of their debt to the public; and the hardships of being limited in this manner were exceedingly

aggravated by the losses sustained, and the expences they had incurred in acquiring and securing the territorial revenues in India, at the risk of their whole capital, while the public reaped such great advantages. The limitation of the company to a term not exceeding six years for the possession of their Indian territories they looked upon to be entirely arbitrary, as it might be construed into a final decision against the company respecting those territories to which they insisted that they had an undoubted right. Neither could they acquiesce in the resolutions by which three-fourths of the surplus nett profits of the company at home, above the sum of 8 per cent. per annum upon their capital stock, should be paid into the exchequer for the use of the public, and the remainder be employed either in further reducing the company's bond debt, or for composing a fund to be set apart for the use of the company in case of extraordinary emergencies; such unheard of disposal of their property without their consent not being warranted by the largest pretensions ever made against them. It was likewise subversive of all their rights and privileges, by denying them the disposal of their own property after their creditors were properly secured by law. Their petition concluded with assuring ministers, that, rather than submit to these conditions, they desired that any claims against the possessions of the company might receive a legal decision; from which, whatever might be the event, they would at least have the satisfaction to know what they could call their own.

543
They are allowed to export tea duty free.

No regard being shown to this petition, the motions were carried in favour of administration. To make some kind of recompense, however, it was agreed on their part, that as the company had a stock of teas amounting to about 17 millions of pounds in their warehouses, they should be allowed to export as much of it as they thought proper free of duty, and employ the money thence arising for the behoof of their own affairs.

549
East India regulations bill brought in.

This concession in favour of the East India company proved in the event the loss of the American colonies; nor indeed could these arbitrary proceedings with such a considerable body tend to impress the minds of any part of the nation with ideas favourable to the views of administration. In other respects the minister abated nothing of the disposition he had from first to last shown with regard to the company. On the 3d of May 1773 the following resolutions were laid down by him as the foundation of a bill for the establishing certain regulations for the better management of the East India company, as well in India as in Europe. These were, 1. That the court of directors should in future be elected for four years; six members annually, but not to hold their seats longer than four years. 2. That no person should vote at the election of the directors who had not possessed their stock twelve months. 3. That the stock of qualification should for the future be L. 1000, instead of L. 500. 4. The mayor's court of Calcutta should for the future be confined to small mercantile causes, to which its jurisdiction only extended before the territorial acquisitions. 5. That, instead of this court, thus taken away, a new one should be established, consisting of a chief justice and three puisne judges. 6. These judges to be appointed by the crown. 7. That a superiority

be given to the presidency of Bengal over the other presidencies in India. Each of these resolutions was carried by a great majority. The salaries of the judges were fixed at L. 6000 each, and that of the chief justice at L. 8000. The governor of the council was to have L. 25,000 annually, and the members of the council L. 10,000 each. By the friends of the company, however, the bill was supposed to have a tendency to effect a total alteration in the company's constitution in England, as well as the administration of all its presidencies in Asia, in order to subject all their affairs, both at home and abroad, to the immediate power of the crown. No delinquency was charged, nor any specific ground of forfeiture assigned, yet by this bill more than 1200 freemen were to be disfranchised and deprived of any voice in the management of their property. By cutting off the L. 500 stockholders, the proprietary would become more manageable by the crown; nor was there any security that the directors would be faithful to the interests of the company when they were no longer responsible to them for their actions. By the establishment of a general presidency over all the affairs of the company, and by the nomination of judges for India, government would in effect transfer the whole management of the affairs of the company to the crown, and the company would have no farther share in the business than to pay what salaries the crown thought fit to assign them. The proprietors of L. 500 stock presented a petition, setting forth, that, by king William's charter granted to the company, and repeatedly confirmed since that time, in consideration of many large sums repeatedly advanced by the company to the public, they were legally possessed of a right of voting at the election of directors, making of by-laws, or in any other matter relating to the affairs and government of the company; but by a clause in this regulating bill they were deprived of this right, and that under a pretence of preventing the pernicious practice of splitting stock by collusive transfers; but so far were the proprietors from giving way to such practices, that in the year 1767 they petitioned parliament for an act, by which the several proprietors intitled to vote should be obliged to hold this qualification six months at least before the exercise of their right, afterwards extending the time to twelve months, rather than the act should fail of its intended effect. This proposed increase of the qualification of the voters, however, could not in any degree answer the end desired; for the splitting of stock being confined to such proprietors as held large quantities, they would find it an easy matter to place their stocks in the hands of half the number of persons, and thus extend their influence in a great and undue proportion; but if ever government conceived designs against the company, they would find it much easier to execute them while the proprietors were few and opulent, than when they were numerous, and at the same time independent and possessed of moderate fortunes. This petition produced a motion in the house of commons, "That it does not appear that the proprietors of L. 500 stock in the East India company have been guilty of any delinquency in the exercise of their charter-rights according to the several acts of parliament made in their behalf." This, however, being rejected, the regulating bill passed in the house of

Britain.

commons

Britain. commons by a majority of more than six to one. In the house of lords it passed by 74 to 17. The duke of Richmond moved for a conference with the house of commons; but this was refused. He then moved that copies of all the papers which had been laid before the commons should be laid before the lords also; but this being likewise refused, he joined six other members in a protest, the substance of which was, that the whole was a scheme of government to get the power and wealth of the company into their hands; pointing out at the same time the many particular infringements on public and private rights by passing the bill.

553
Investigation of the Company's Affairs by the select and secret committees.

All this time inquiries went on by the select and secret committees; the affairs of the company were investigated from the year 1756, and many witnesses examined concerning them. A report was presented by general Burgoyne, containing many charges of cruelty and rapacity in the conduct of several gentlemen concerned in the management of the affairs of the company; particularly with regard to the deposition of Surajah Dowlah in 1756. This was said to have been the origin of all the evils that had happened since that time. He insisted much on the treachery used in bringing about that revolution, and particularly the fictitious treaty with Omichund; exposing the conduct of lord Clive, who had caused admiral Watson's name to be affixed to that treaty, which the admiral had refused to sign in person. He concluded with moving for the restitution of all the money received in presents or otherwise in India, while the receivers acted in a public capacity; and at last stated the following resolutions: "That all acquisitions made under the influence of a military force, or by treaty with foreign powers, do of right belong to the state; that to appropriate acquisitions obtained by such means is illegal; and that great sums of money had been obtained by such means from the sovereign princes in India." The general belief that many of the company's servants had acted in a most infamous manner, was at this time so strong, that the above resolutions were carried almost unanimously. Lord Clive defended himself by general protestations of innocence; which, however, gained but little credit, till he entered into a particular refutation of the charges against him. His friends were not of opinion that these were of an atrocious nature, and wished to excuse him by policy, necessity, &c. rather than load him with any great degree of guilt. The treaty with Omichund was justified by necessity. Some said, indeed, that as Omichund had the character of the most accomplished villain in Asia, an Englishman only wished to have a trial of skill with him. This severe sarcasm, however, was a mere piece of wit, without any solid foundation; for the crime, if any there was in that transaction, undoubtedly lay in the dethroning a sovereign prince by means of traitors, not the cheating of these traitors of their reward. Indeed, if once we admit treachery into our dealings at all, it is in vain to pretend any subjection to the rules of justice; for we are already beyond its jurisdiction.

General Burgoyne now moved, "That Lord Clive, in consequence of the powers vested in him in India, had received at various times presents to the amount of L.234,000 Sterling, to the dishonour and detri-

ment of the state;" but this being rejected after violent debates, the following was substituted: "That Lord Clive did, in so doing, abuse the power with which he was entrusted, to the evil example of the servants of the public." This also being rejected, another was added, "That lord Clive, when he received the sum above mentioned, did at the same time render great and meritorious services to his country." Thus the matter was concluded, and the affairs of the company delivered into the hands of administration, who declared that their regard for its welfare was the sole motive for bringing about this revolution.

cc6
The affairs of the East India company were succeeded by those of America. The ill humour occasioned by the taxes laid on that country has been already taken notice of. The stamp act had excited among them a spirit of industry, economy, and a desire of serving themselves with their own manufactures, which had never been forgotten. This was at that time, as well as afterwards, imputed to wilfulness, or the discontent of a few, which would afterwards subside of itself, or be suppressed by the voice of the majority; when things would of course revert to their old channel. The trifling tax on tea, however, which had not been repealed, and the allowance given to the company to export what quantities they pleased, now threw matters into a ferment not to be quelled by any means whatever. The various proceedings in America, the tumults, and subsequent war, are fully taken notice of under the article *United States of America*. Here it only remains to give an account of the manner in which the legislature and people of Great Britain were affected by these events. It has already been remarked, that ever since the conclusion of the peace in 1763 the disposition shown by government to augment the revenue, for which indeed there was at that time an evident necessity, had produced in the popular party of Great Britain a spirit very similar to that manifested by the Americans, though in an inferior degree; so that the patriots of Britain affected to consider the Americans as oppressed by government, and suffering in the same cause with themselves. The destruction of the tea at Boston and other places in America, however, considerably diminished the number of their friends, and made many of those who still adhered much less sanguine in their cause. The matter was announced to parliament by a special message from the throne. Lord North and the other ministers set to the conduct of the colonists, particularly of the town of Boston, in a most atrocious light, and concluded that now government was perfectly justifiable in any measures they might think proper to redress the wrong, and inflict such punishment on the town as the enormity of the crime seemed to deserve. Opposition did not pretend to exculpate, though it was still attempted to excuse them by deriving all the disturbances in that country from the arbitrary and absurd measures pursued and obstinately adhered to at home. This heavy charge the ministry evaded by drawing the attention of the house to the more important consideration, Whether the Americans were now to be dependent, or independent, on Great Britain? The Boston port-bill being then brought on, was carried, but not without considerable opposition, both within and without doors. A petition was last presented by Mr Bolla, agent for

Britain.

the council of Massachusetts bay, urging an act of queen Elizabeth for the security of the liberty of the colonies. This was presented before the bill had actually made its appearance; but so little regard was paid to it, that, during the very time it lay on the table, the bill was brought in by lord North. After it had passed two readings, that gentleman presented another, desiring to be heard in behalf of the town of Boston, for the council of Massachusetts bay. This was absolutely refused; because, though Mr Bollaun was agent for the colony, he was not for the corporation of the town of Boston. Neither could he be so for the council of Massachusetts bay; for as that was necessarily fluctuating, the body which had appointed him was now no longer existing. This appeared very inconsistent to many of the members, and produced a greater opposition in the house than would otherwise in all probability have ensued. A new petition quickly followed from the lord mayor, in the name of the natives and inhabitants of North America residing at that time in London. This was written in a more spirited style, and boldly insisted that the bill was illegal, unprecedented, unjust; and that, under such a precedent, no man or body of men in America could have a moment's security; the charge being brought by the enemies of the town, and the punishment inflicted without hearing them in their own defence, or even making them acquainted with the charge; and they concluded with these remarkable words, that "the attachment of America would not survive the justice of Britain." As little regard being paid to this as to the former petitions, and all proposals for a delay rejected, the bill passed both houses without a division; the minority, notwithstanding their opposition, not choosing to dissent publicly from the first step taken by government to reduce the disobedient colonies. That this obnoxious bill might not be sent to America without some mitigation, however, they proposed the repeal of the duty on tea laid on in 1767; but this was also rejected, probably from a vain expectation that the opposition of the Americans was that of a mere tumultuous mob, and that by showing a proper spirit and perseverance the ministry could not fail to come off victorious at last.

The extreme obstinacy shown by ministers, in this first instance, undoubtedly proved very prejudicial to their cause, not only by exasperating the Americans, but by rousing the indignation of minority, and making their opposition so violent and determined, that the Americans could not but conclude that they had a very strong party in their favour on this side of the Atlantic. This appeared in every subsequent transaction relating to the colonies. The bill for regulating the government of Massachusetts bay did not pass without a protest, from which we shall only extract the following sentence: "This act, unexampled in the records of parliament, has been entered on the journals of this house as voted *nemine dissentiente*, and has been stated in the debate of this day to have been sent to the colonies as passed without a division in either house, and therefore as conveying the uncontroverted universal sense of the nation. The despair of making effectual opposition to an unjust measure has been continued into an approbation of it."

The like consequences ensued on passing the act for

ing bill.

the impartial administration of justice. In the protest on this occasion the lords used the following expressions: "The bill amounts to a declaration, that the house knows no means of retaining the colonies in due obedience but by an army rendered independent of the ordinary course of law in the place where they are employed. A military force sufficient for governing upon this plan cannot be maintained without the inevitable ruin of the nation. This bill seems to be one of the many experiments towards the introduction of essential innovations into the government of this empire. The virtual indemnity provided by this bill for those who shall be indicted for murders committed under colour of office, can answer no other purpose. We consider that to be an indemnity which renders trial, and consequently punishment, impracticable. And trial is impracticable, when the very governor, under whose authority acts of violence may be committed, is empowered to send the instruments of that violence to 3000 miles distance from the scene of their offence, beyond the reach of their prosecutor, and the local evidence which may tend to their conviction. The authority given by this bill to compel the transportation from America to Great Britain of any number of witnesses at the pleasure of the parties prosecuting and prosecuted, without any regard to their age, sex, health, circumstances, business, or duties, seems to us so extravagant in its principles, and so impracticable in its execution, as to confirm us further in our opinion of the spirit which animates the whole system of the present American regulations."

A still greater opposition was made to the Quebec bill, inasmuch that, before it could be carried, the ministers were obliged to drop much of that high and aspiring tone to which they had accustomed themselves in talking of American affairs. The minority contended, that here, without any necessity pleaded, or even suggested, an arbitrary influence was extended by act of parliament to that province, furnishing a dangerous precedent, and an additional instance of the aversion which ministry bore to the rights of the people. They argued likewise in favour of the mode of trial by juries, and thought that the establishment of the Roman catholic religion there gave it a preference over the Protestant, which was now only to be exercised by toleration. The people at large also were alarmed at the religious part of the bill, and it is not impossible that the suspicions conceived at this time might contribute in some measure to the dangerous insurrections of 1779 and 1780.

At the conclusion of the session his majesty expressed the greatest satisfaction at what had been done, and hopes of the good effects that would attend the new regulations. The reception they met with in America is related in its proper place; in Britain the people seemed to wait the event with indifference, but their bad success with the colonists furnished the minority with new matter of reproach to cast on administration. The parliament in the mean time was dissolved by proclamation, and a very short time allowed for the election of new members; so that if opposition at that time had any strength, they had not now time to exert it. The new parliament met on the 30th of November 1774; when his majesty acquainted the houses that a tary pro- most daring spirit of resistance still prevailed in Ameri-

Britain.

Britain. ca, notwithstanding the most proper means had been taken to prevent the mischiefs thence arising, and assured them that they might depend on a firm resolution to withstand every attempt to weaken or impair the supreme authority of this legislature over all the dominions of the crown. In answer to this speech the minority demanded a communication of all the letters, orders, and instructions relating to American affairs; but this being over-ruled, and the address carried as a matter of form, American affairs were delayed, in spite of all opposition, till after the holidays. In the question on the address, the strength of administration was to that of their adversaries as 262 to 73.

564 In the beginning of 1775 the minority received a considerable accession of strength by the return of lord Chatham, who, after long absence, again made his appearance in parliament. He now testified his disapprobation of the measures which had been pursued with regard to America in the warmest terms; moved for addressing the king to recall the troops from Boston; predicted, that if ministers went on in the way they had done for some time, they would make the crown not worth the king's wearing; that the kingdom was undone, &c. All his eloquence, however, proved at this time ineffectual; administration was determined upon forcing the Americans into subjection, and his motion was rejected by 68 to 18.

565 Lord North now presented the papers which had been called for by the minority; but, lest the publication of particular names should prove detrimental to individuals, only such parts as administration thought proper for public inspection were laid before the house. This was complained of, but to no purpose; and the papers, in their mutilated state, were laid before a committee of the whole house. In the mean time petitions against coercive measures with America had been received from most of the trading companies of the kingdom; which, though highly displeasing to administration, could not be absolutely rejected, though it was fully determined not to yield to their requests in the smallest degree. A committee was therefore appointed to take them into consideration, which was not to take place until the American affairs were also considered. The reason given for this method of proceeding was, that the consideration of commercial matters ought not to interfere with those of the political kind; each of them being sufficiently embarrassing without any other. This delay of hearing these petitions was supposed to be an absolute rejection of them in effect;

567 and so indeed it proved to be, the committee to which they were consigned being humorously called the *committee of oblivion*. The merchants of London, however, were determined not to give up the point until they had exerted themselves to the utmost. They drew up a paper in which they denied the distinction established by ministry. They affirmed that the connection between Great Britain and America was chiefly of a commercial nature, and that the manifold regulations adopted for the mutual prosperity of the colonies and of the mother country formed the great political chain which united them to one another. Questions of commerce and policy, therefore, with regard to them, ought never to be divided, but examined jointly, and could never be thoroughly understood if considered in any other way.

This remonstrance was seconded by all the powers of opposition; but the truth was, that administration had already determined what line of conduct they were to follow, and therefore wished to hear as little as possible on the subject. "War (says Dr Andrews) was now the word; and notwithstanding no weightier reason could be given for not attending to what the merchants had to say, than this very determination, yet that was the very motive that impelled ministers to refuse them a hearing, lest these should make it appear how unwise it was to precipitate the nation into such a measure."

But though there is not the least reason to doubt that administration were now fully determined upon a war, and therefore wished to be troubled with as few objections as possible, they were by no means deficient in arguments for the defence of their own conduct. They alleged that the petitions so much recommended to the attention of the house were principally the work of a factious party. The advantages accruing from the American trade were owing to the dependent situation of the colonies, who now aimed at a superiority over Great Britain, or at least at shaking off entirely the superiority which the mother country had till now exercised over them without the smallest complaint. It was the advantage of the merchants themselves that was consulted by maintaining that superiority; and the merchants themselves would be the first to feel the bad consequences of its being lost. War and its consequences are no doubt very terrible, but sometimes are necessary, to prevent greater evils. The greatest evil that can befall a trading nation is the loss of its commerce; and were the Americans to persist in their courses at that time for a few years longer, this consequence must inevitably ensue.

It was besides insisted, that though administration were to yield the present contest, the warmest advocates for America could not pretend to say what would be the list of its demands. The Americans aimed in reality at the repeal of whatever appeared obnoxious to their immediate interest: But that, and their real interest, differed very much. The greatest political evil that could befall them was to be deprived of the political and commercial support they received from Great Britain; and to this they must ultimately submit, if they should ever succeed in the pursuit of that delusive phantom of independence which they now accounted their happiest situation. In short, administration insisted, not without a great show of reason, that the Americans were not to be reclaimed by concessions. Mercantile people indeed might imagine so, from the facility with which concessions would be made, and the speed with which tranquillity would be restored. But tranquillity procured in this manner would last no longer than till the colonies, untrammelled by any regulations, perceived, or imagined they perceived, the benefit of dealing with other countries, and turned their own commerce, wherever they thought proper. This was the point at which they inevitably aimed, whatever they might pretend to the contrary; for, notwithstanding the boasts they made of the vast business transacted with Britain, it was well known to arise from the immense credit they were indulged with there, and which they could not expect elsewhere.

The honors and character of the nation were now

Britain. also said to be at stake. The British had often taken up arms for matters of less consequence; why then should they now hesitate in a case like the present, where honour and interest both called upon them for the most vigorous and speedy exertions? Formerly it was the custom of the merchants to second the wishes of ministry in this respect, instead of opposing them. The inconvenience of suspending their profits for a time must be submitted to, and their enemies would experience as many if not more of the same kind; and it would be unworthy of the character they had so long sustained to yield to indignities for the sake of profit. The losses above mentioned, however, would be but trifling in comparison of those that would follow in time to come, should Britain from want of spirit give up the assertion of her just rights. This was a policy hitherto unknown in Britain, which had heretofore been noted for the ardour and celerity with which they were maintained.

570
On the petition of congress to the king.

The end of all this altercation was, that the motion in favour of the merchants petitions was rejected by 250 to 89. This point, however, was no sooner discussed, than a violent debate arose about the petition of congress to the king, which had been delivered, and by him referred to parliament. It was argued by administration, that no petition could be received from the continental congress, which was no legal body, and it would be admitting their legality to receive a petition from them; the general assemblies and their agents were the only lawful representatives of the colonies, and none else would be admitted. Opposition replied and argued as much as possible, but to no purpose; and, after an ineffectual struggle, they had the mortification to find that the petition was finally rejected by 218 to 68.

571
Chatham's conciliatory plan rejected.

In the mean time a conciliatory plan was prepared by the earl of Chatham, which was presented on the 1st of February 1775. The intent of his bill, he said, was to settle the troubles in America, and to assert at the same time the supreme legislative authority and superintending power of Great Britain over her colonies. This was to be done by their acknowledging on their part the supremacy of the British legislature and the superintending power of parliament. No taxes were to be levied in America, but with the free consent of their assemblies. It asserted a right in the crown to keep and station a military force established by law in any part of its dominions; but declared, that it could not be legally employed to enforce implicit and *unlawful* submission. A congress might also be held, in order to recognize the supreme sovereignty of Great Britain over the colonies, and to settle, at the same time, an annual revenue upon the crown, disposeable by parliament, and applicable to the exigencies of the nation. On complying with these conditions, the acts complained of by congress were to be suspended, with every other measure pointed out as a grievance, and the constitution of their governments to remain as settled by their charters. This bill was, however, deemed at once totally inadmissible, on account of its alleged partiality to America, by the various concessions it enacted, and particularly by empowering the colonies to assemble in congress; a measure which, of all others, was at that time the most

offensive, and supposed to be the most injurious to the British interests. Britain

Lord Chatham was by no means deficient in arguments in support of his favourite plan; but these, though supported by all the powers of eloquence, proved unsuccessful; the proposal was ultimately rejected by 61 to 32. So determined were the majority in giving this an entire rejection, that it was not even permitted to lie upon the table; which, however, may be considered as a piece of indignity offered to that great man, proceeding rather from the indifference with which he had been received at court for some time, than from any real and thorough conviction of the inutility of the plan he proposed.

A new petition was next presented to the house of commons by the proprietors of estates in the West India islands; representing their alarm at the association of the Americans, and their intended stoppage of trade with the British islands; the situation of which, they said, would be very calamitous, if the acts in question were not immediately repealed. The trade of these islands was at that time of the most extensive nature. All quarters of the globe were concerned in it; the returns centered in Britain, and were an immense addition to its opulence, inasmuch that the British property there amounted to no less than 30 millions sterling. But the West Indies, however wealthy, did not produce the necessaries of life in sufficient abundance for their inhabitants. Large importations were continually wanted, which could only be supplied from North America; and were they to be cut off from a communication with that continent, they would shortly be reduced to the utmost distress. Such was the substance of this petition; to which no more attention was paid than had been to the rest. To administration all petitions now appeared to be the contrivance of faction; and it was said, that however inconvenient the coercive measures might be, they ought not to be retarded by the consideration of any temporary losses. As it was necessary, however, to let the nation know the ultimate resolves of administration respecting America, it was at last done by lord North in a long speech, in which the most remarkable circumstances relating to the dispute were enumerated. It was asserted, that universal fermentation then prevailing in America, proceeded from the unwarrantable arts and practices used to dispose them against the ruling powers in Britain; and asserted, that, notwithstanding all their complaints, the public charges borne by individuals in America were, on the strictest computation, not more than 1 to 50, when compared with what was paid by individuals in England. Nothing, therefore, but a settled determination to quarrel with the parent state could induce the Americans to persist in their disobedience to the lawful injunctions laid upon them, which were neither injudicious nor oppressive; but, on the contrary, framed with all possible lenity, and counterbalanced by advantages which were not possessed by Britain. It was therefore a spirit of resistance which animated America, and not a discontent at oppressions which plainly had no existence. For this reason it was proposed to the house to send a greater force to America; and to pass a temporary act, suspending all the foreign trade of the different colonies of New England, and

572
Petition of the West India planters

573
Rejected.

and particularly the Newfoundland fishery, until they consented to acknowledge the supreme authority of the British legislature, &c. upon which these restrictions should be taken off, and their real grievances, if any such there were, redressed upon making proper application. New England, they said, was justly singled out upon this occasion, as being the most guilty of the whole. The others, as less faulty, it was hoped, would yield with less compulsion; but the question now was simply, Whether we would at once abandon all claims on the colonies, and instantly give up the advantages arising from our sovereignty, and the commerce dependent on it? or, Whether we should resort to the measures indispensably necessary to ensure both?

An address was now carried, which, in the ideas of opposition, amounted to an absolute declaration of war. The consequences, therefore, were painted out with the utmost freedom, and some even denied the charge of rebellion fixed on the province of Massachusetts bay. The people there, they said, had done nothing but what the constitution allowed: they had resisted arbitrary measures; and the examples so frequently set them at home were sufficient to justify their conduct. The appellation of *rebels*, they said, was dangerous, and might better be spared; it would only serve to render them desperate, and inspire them with a determination to resist to the last, from an apprehension that their lives and properties were forfeited. This last consideration, however, was made very light of by administration. Great stress, they said, was laid upon the union of the colonies, but a very little time would show with how much impropriety. The principles on which they were associated were too self-denying to be supported by human nature, and were too inimical to the interest and feelings of individuals to bind them long together. In other respects this union of the colonies might be viewed with indifference, and even contempt. The natives of America, it was said, were no soldiers; they were averse to military discipline, and incapable of subordination; they were of a slothful and spiritless disposition; uncleanly, liable to sickness, and easily overcome by fatigue. Such people as these would never face a British army; and a very small force would be necessary to put an end to all their projects of independence.

These were the principal arguments for and against this address, which was carried by 296 to 166: but so important was the subject of it deemed by the minority, that a motion was made for recommitting it on account of the consequences that would probably result from the prosecution of the measures recommended. A very long and violent debate ensued; the event of which was, that administration contended as usual for the necessity of enforcing obedience with fire and sword. The Americans, they said, were become incorrigible through forbearance; lenity was a subject of derision among them, and was imputed to imbecility and fear; they imagined themselves able to abolish the sovereignty of Britain in that country, and were now resolved to do it. It was therefore incumbent on every native of Britain, in such a case, to stand forth, and vindicate the interest and glory of his country; and it was the duty of parliament and ministry to call forth the whole spirit of the nation to a contest in which

every thing dear to them both in their public and private capacities was so deeply concerned.

In this, and some former debates, the danger of being involved in foreign wars on account of the colonies had been insisted on; but this was looked upon by administration to be improbable. It was hardly to be imagined, they said, that foreign powers would behave in a manner so very impolitic as to encourage rebellions in other colonies, which might, in a very short time, become precedents for imitation in their own. The number of friends to government in America was likewise very much relied upon. A proper reinforcement to the troops already there would encourage those to declare themselves who were at present too timid to avow their sentiments: These, if duly supported, would be found to be no inconsiderable number; and, when added to the forces stationed among them, would undoubtedly counterbalance the power of the malcontents. This project of arming the Americans against one another was reprobated by opposition more than all the rest. The address itself was a measure replete with barbarity as well as imprudence; tending to put arms in the hands of every man throughout the continent who suspected the designs of the British administration, and to expose to ill usage and ruin every person who was known, or imagined, to be a friend to Great Britain. The Americans were said to aspire at independence; but if any thing could bring this about, it would be the conduct of ministry. The most obedient and loyal subjects cannot have patience for ever with a tyrannical government. They will undoubtedly rise at last, and assert their rights; and those who style them rebels on that account ought to remember, that oppression not only produces but justifies resistance. It had always been believed by the Americans, without any contradiction from Britain, that internal taxation in America belonged to the assemblies of the colonies, and to them only. There were opinions in all nations, which the legislature would respect, while they produced no bad consequences. This opinion ought not therefore to have been attacked at such an improper season, after having been virtually recognized by the repeal of several acts, and approved by some of the most learned and intelligent people in the kingdom. It was the greatest misfortune that could befall a state, when its rulers endeavoured, without any apparent necessity, to alter the system and maxims of government long adopted, and the utility of which had been confirmed by experience. This was, however, the case with Britain. The mildness and benignity which was wont to direct the measures of former ministers was now laid aside for severity and imperiousness; while implicit obedience was imposed upon the colonies, as the only condition by which they could purchase peace. The aspersions of cowardice, so largely thrown upon the Americans by the ministerial party, did not pass unnoticed. It was observed, however, that were there ever so just, the very nature of their country would fight for them. By this alone our military enterprises would be retarded and impeded in a considerable degree; while the sinews of war would undoubtedly be greatly relaxed, as the suspicion of such a considerable commerce as that of our colonies could not fail to be severely felt.

Britain.

Besides all this, the views and principles of ministers were attacked in the most violent manner. They were said to be reviving the old exploded doctrines of hereditary right and passive obedience.—They required the Americans to submit unconditionally to the will of Great Britain, for no other reason but because she was the parent state; but if no better reason could be produced, they could not be justly blamed for their disobedience. The ties between Great Britain and her colonies, however, were of a far more noble as well as more binding nature than even origin and consanguinity. These ties were the constitution transmitted from Britain, and the brotherly assistance hitherto afforded them by Englishmen; and which ought to render the name dear to them. While these ties remained unviolated, there was no room to complain of their behaviour; but they would never submit to despotic authority in Englishmen more than in any others. Such unwarrantable principles rendered it no longer a question, whether the measures of administration should be considered, but whether the ministers themselves ought not to be deprived of the power they exercised so unconstitutionally? And the question was not now between Great Britain and America, but, whether we should give up our colonies or our ministers?

Language of this kind excited the indignation of the ministerial party to a very high degree. They now charged ministry, in very plain terms, with the guilt of all that had happened. A factious republican spirit, they said, was gone forth; by which every person who wrote or spoke on the American cause was actuated; and which had not only induced the Americans to commence a rebellion against the parent state, but had filled the house with incendiaries. The final issue of the dispute was, that the recommitment of the address was lost by 288 to 109. The debates were the most violent that had ever been known in the British parliament; and so important was the subject reckoned, that not only the natives of Britain, but even the foreign ministers in London, watched the motions of administration with the utmost anxiety, as considering it a point which might probably give a new face to the affairs of all Europe.

All these victories of administration were not sufficient to prevent new enemies from starting up. Petitions had been preparing by the London merchants trading to America, and from those concerned in the West-India trade, to be presented to the house of lords. This task was undertaken by the marquis of Rockingham, but he was prevented by a previous motion in favour of the address. A long and violent debate, however, ensued concerning the necessity and propriety of receiving them. The papers on which the address had been founded were said to be partial and mutilated, for which reason the house ought to pay the greater regard to the representation of the merchants; whose testimony, as persons deeply and essentially interested in bringing truth to light, might be depended on with much greater safety. It was urged, that they earnestly desired to be heard before the house took any final determination with regard to America; a refusal would amount to a public declaration, that parliament was resolved to oppose the sense of the petition, right or wrong; and such treatment was in every re-

spect unwarrantable, and no less contrary to sound policy than to equity and good manners.

All these representations, however, had no weight with administration: they affected great sorrow at being obliged to declare that the petition could not be received consistently with the interest of the kingdom; they put the merchants in mind that the American proceedings threatened fatally to diminish the commercial greatness of this kingdom, in which case none would suffer so much as themselves; and they insisted that confidence ought to be put in the wisdom of parliament, as it was not doubted that by properly asserting the supremacy of the British legislature in the manner proposed, all those advantages about which they were so anxious would be secured. They were therefore exhorted to submit to temporary inconveniences, which could not be avoided in the present posture of affairs, though probably they would not be of long duration.

In the mean time matters went on from bad to worse in New England; so that it was soon perceived either that the friends of government in that colony did not exert themselves, or that they were far from being so numerous as had been imagined. In order to make their coercive plan the more effectual, therefore, it was now judged necessary to extend it so that every individual of the colony should become sensible of the punishment. This, it was supposed, would be done by a bill for restraining the four provinces of New England from commerce with Great Britain, Ireland, or the British West India Islands; and prohibiting them from carrying on the fishery at Newfoundland. The reasons given for this were, in substance the same with those for the others; and indeed both parties had now so much exhausted their arguments, that very little new matter was left for either. Every step taken by ministry, and every proposal made by them, however, produced a violent debate; and though they constantly gained the victory, it was not without the mortification of hearing their principles and conduct reprobated in the most opprobrious manner. In the present instance the bill was carried by 261 against 85; but a petition against it was quickly offered by the London merchants concerned in the American trade, setting forth the danger that would accrue to the fisheries of Great Britain from such a prohibition.

From the evidence brought in support of this petition it appeared, that ten years before the American fisheries had been in such a flourishing state, that the four provinces of New England alone employed near 46,000 ton of shipping and 6000 seamen; and that the produce of their fisheries in the foreign markets amounted, in the year 1764, to upwards of L. 320,000. Since that time they had greatly increased; and what rendered the fisheries particularly valuable was, that all the materials used in them, excepting only the timber for building the vessels, and the salt for curing the fish, were purchased in Britain, and the nett proceeds of the trade were also remitted thither. It appeared also, that it would not be practicable to transfer these fisheries to Halifax or Quebec, though ever so much encouragement were given to either of these places, as they had neither vessels nor people to man them, and would never be able to procure supplies of seamen

Britain.

entrusted, from a persuasion that the enemy to be encountered was not to be feared, and could easily be overcome.

580
Of the inhabitants of Nantucket.

Some other circumstances were likewise urged as strong reasons against this bill; particularly the commercial concerns of the city of London with New England (to which alone the colony stood indebted for near a million), and the bad consequences of it to the people of Nantucket. This is a barren island, lying off the coast of New England, about 15 miles long, and three broad, containing about 6000 inhabitants, almost all quakers. The natural produce of this island, it was alleged, could not maintain 20 families; but the industry of the inhabitants was such, that they kept 130 vessels constantly employed in the whale-fishery, which they carried on in the north seas, to the coasts of Africa and Brazil, and even as far as the Falkland islands and the shores of Terra Magellanica. These people, it was said, ought undoubtedly to have been exempted from the common calamity, were it only from the applause due to so much industry and resolution.

The final resolution of reducing the colonies by force being now taken, it became necessary to make proper preparations for the purpose; and in this the conduct of administration was little less censured than in other respects. As the above-mentioned opinion, that the Americans were timid and incapable of becoming soldiers, prevailed greatly at that time, a force of 10,000 men was judged sufficient to reduce the province of New England to obedience. This was vehemently opposed by the minority. They insisted that the force was totally inadequate, and only calculated to produce expence to no purpose. The first impression, they very justly observed, ought to be decisive, if possible; and in order to render it so, it was necessary to send such a fleet and army as might ensure the confidence of the public, and be certainly capable of surmounting all obstacles. Many of the friends of administration were of the same sentiments in this respect; and the only reason assigned for acting otherwise was an hope that the Americans would, upon more mature consideration, desist from their opposition. That they might the more readily be induced to this submission, lord North's conciliatory proposition was formed. By this it was enacted, that when the governor, council, and assembly of any of the colonies should propose to make a provision for the common defence, &c. and if such provision should be approved of by the king in parliament, the levying or imposing of taxes on that colony should then be forborne, those duties excepted which it might be expedient to impose for the regulation of commerce; the net produce of which should be carried to the account of the colony where it was raised. But this proposal, though highly extolled by the friends of administration, was no less reprobated by minority than the others had been. It was said to be insidious, and calculated for the purpose of raising a revenue, which was now said to be the object of ministers. There was no essential difference between the present and former modes of taxation. The colonies were as effectually taxed without their consent by requiring them to pay a stated sum, as by laying a number of duties upon them to the same amount. There was besides a capital deficiency in the proposal; that no sum was specified; so that the Americans were left totally ignorant of what the demands of Britain might be. After a long debate, however, the question was carried in favour of administration by 274 to 88.

591
On the force to be sent to America.

60
Lord North's conciliatory bill.

581
Remarkable protest against the restraining bill.

The instance of Nantucket was so strong, that administration, with all their obduracy, were obliged to relax a little; and, of their own accord, afforded them the relief they had such just reason to expect. That the petition in the main might prove unsuccessful, however, another was presented by the inhabitants of Poole, the tenor of which was directly opposite to that of the city of London. In this it was set forth, that the restrictions proposed by the bill would not prove detrimental to the trade of England, which was fully able, with proper exertions, to supply the demands of foreign markets. The advantage of the Newfoundland fishery more than that of New England to this country was, that it bred a great number of hardy seamen peculiarly fit for the service of the navy, while the New England seamen were, by act of parliament, exempt from being pressed. It appeared also from the examination of witnesses taken in support of this petition, that the fishery from Britain to Newfoundland employed about 400 ships, amounting to 360,000 tons, and 2000 shallops carrying 20,000 tons and navigated by as many seamen. Each season produced 600,000 quintals of fish, and the returns at a moderate rate were valued at £. 500,000.

The like fate attended a petition to the throne from the island of Jamaica. Instead of relaxing a y thing of their severity, the ministry now included the southern colonies in the restrictions laid on New England. Still, however, the petitioners were ind fatigable in their endeavours to be heard. The West India merchants and planters seconded their last petition by a large detail of circumstances relating to the British islands in that part of the world. This affair was conducted by Mr Glover, a gentleman equally celebrated for his literary talents and commercial knowledge. From his investigations it appeared, that, exclusive of the intrinsic worth of the islands themselves, their stock in trade and other property amounted to no less

604
The West India merchants.

This bill was debated with great animosity in the house of peers, and produced a remarkable protest, in which the measures of government were spoken of with great severity. "That government (said they) which attempts to preserve its authority by destroying the trade of its subjects, and by involving the innocent and guiltily in a common ruin, if it acts from a choice of such means, confesses itself unworthy; if from inability to find any other, admits itself wholly incompetent to the end of its institution." They also reprobated in severe terms the assertion already mentioned, that the Americans wanted spirit to resist, and that Britain would find them an easy conquest. Such language was represented as altogether void of foundation, and the mere effect of party spirit and resentment. It was also the more imprudent and unadvised, its tending, in case of coercive measures, to slacken the care and solicitude with which they ought to be pursued, and to occasion remissness in those to whom they might be

Britain. than 60 millions; the exportation to Britain had of late been near 200,000 hogheads and puncheons of sugar and rum, amounting to no less than four millions in value; the direct revenue arising from which was 700,000 pounds, besides that which accrued from the collateral branches depending upon it. All this, however, was urged in vain. Conciliatory proposals were made by Mr Burke and Mr Hartly, but they were rejected by great majorities. These proposals, indeed, instead of serving the cause they were meant to promote, did the very reverse. A dread was entertained of the consequences which might ensue from the republican opinions now so prevalent in the colonies, and all partiality towards them was looked upon in such a criminal light, that their opponents became deaf, on many occasions, to the voice of reason and humanity when urged in their behalf. On the other hand, the favourers of America, urged on by a furious zeal, and even resentment against those whom they looked upon to be promoters of arbitrary measures, erred equally in their opposition to ministry. This violent party spirit appeared not only among the people at large, but broke forth with the utmost fury in parliament, where the debates often resembled the railings of Billingsgate rather than the deliberations of the first assembly in a great and powerful nation.

In this temper of mind it is no wonder that the state of affairs was scarce ever truly represented by either party. Government continued to enact new laws, now in vain, against the Americans; their antagonists opposed these in a manner so little different from what has been already related, that any farther account of the debates would be as unentertaining as tedious. Other petitions were presented and treated with neglect. The increase of union and preparations for war among the colonists were by the ministerial party treated as the mere commotions of an headstrong mob; and by the other as an association of an injured and virtuous people, who were about to found a mighty empire in the west, while Britain was to sink in utter disgrace and contempt by their mere secession, without making any account of their exploits in the field, which could not fail to equal those of the heroes of antiquity. On the same principles the event of the skirmish at Lexington was magnified by the one into a "disgraceful defeat" on the part of the British; and by the other treated with absolute unconcern, as if no regard whatever was to be paid to it, nor any inference drawn from thence concerning the fate of the war in general. Thus also the battle at Bunkers Hill, and all the transactions of the year 1775, were unfairly stated by both parties; and the only consequence ensuing from these misrepresentations was the inflaming to a violent degree the resentment betwixt the two parties; one of which depressed the Americans to the rank of consummate poltroons, while the other exalted them almost to that of demigods.

While these altercations continued to agitate the minds of the superior classes of people in Britain, the middle and lower ranks remained in a kind of indifference, or rather were against the proceedings of ministry. This opposition could not indeed influence the councils of the nation, but in other respects it proved very

troublesome. The levies were obstructed, and the recruiting service was never known to go on so heavily; numbers of people of that description not only refusing the usual proffers, but even reprobating the cause in which they were solicited to engage. Besides this, several officers of high rank showed a great aversion to the service. Lord Effingham, who had distinguished himself by his opposition to ministerial measures, resigned the command of his regiment rather than fight against the cause he had espoused so warmly. His example was followed by that of several other officers; and it is not to be doubted that, while this step conferred upon them a very considerable share of popularity, it excited in the minds of ministry an equal degree of resentment. Lord Effingham, in particular, received the public thanks of the city of London and Dublin; both of which showed an extreme aversion to the commencement of hostilities with America. The former, indeed, could scarce restrain themselves within any bounds of moderation. After the affair at Lexington they framed a remonstrance and petition, animadverting in the most severe manner on the ministry and parliament; and it was not without the greatest difficulty that the more moderate party procured one to be drawn up, under the name of a "humble petition," couched in less reprehensible terms.

In the mean time several inconveniences began to be felt in different parts of the nation. The suspension of the sale and purchase of negro slaves in the West Indies and in North America, and the prohibition to export arms and gunpowder, had greatly impeded the African trade from Bristol and Liverpool. In consequence of this, a great number of ships which formerly sailed from these ports had been laid up, and near 3000 sailors belonging to Liverpool dismissed from service. Their situation soon rendered them riotous; and it was not without the assistance of the military that they were quelled. These distresses, however, made no impression on administration; who having once laid it down as a maxim, that the subjection of America was the greatest political good that could happen to Britain, were, in a consistency with their own principles, obliged to overlook every disaster that might happen in the mean time as a temporal inconvenience, which ought not to be regarded in the prosecution of a great and magnificent plan.

But whatever might be the views of administration in this respect, it was far otherwise with the generality of the nation. They felt the present inconveniences severely, while the subjugation of America presented them with no solid foundation to hope for an equivalent. It was with the utmost satisfaction, therefore, that they received the news of Mr Penn's arrival in 1775, with a new petition from the congress to be presented to the king; after which he was to give it to the public. Their expectation, however, was soon disappointed. The petition was delivered to lord Dartmouth on the first of September; and in three days it was replied, that no answer would be given to it. This laconic procedure excited no small surprise, as it was universally allowed that the language of the petition was respectful, and that it expressed the highest desire of peace and reconciliation. Lord Dartmouth's answer, therefore, could not but be considered as a final renunciation

Britain.

renunciation of all friendly intercourse with the colonies, and which would drive them into a connection with foreign powers; a resource at which they themselves had hinted when they first took up arms. It was also thought not only to be injudicious in itself, but very ill-timed, and not at all consistent with the situation of the affairs of Britain at that time. On the other hand, the friends of administration insisted, that the petition offered nothing that could in a consistency with the dignity of the British empire be taken any notice of. Instead of professing any repentance for their own conduct, they had offered stipulations, and even required concessions on the part of Britain. It was likewise said on the part of administration, that fear had a share in framing the proposals now held out. The Americans were very sensible, that though the first steps taken by Britain had not answered the purpose, much greater efforts would quickly follow; and that, without being allowed some time, it was impossible they could bring their matters to bear. The petition, therefore, might be considered as written with a view to procrastinate matters, which was by no means admissible on the part of Britain. The colonies were already well apprized of the conditions on which they would be restored to favour; and had it at any time in their power to put a stop to the operations of war by accepting these conditions: but it would be imprudent to stop the military preparations upon such an uncertain expectation as the petition from congress held out. It was also plain, that a great majority of the nation approved of the measures of government; for addresses were received from all quarters, recommending, in the most explicit manner, a vigorous exertion against America.

593
Revival of
the distinction
and animosity
between whigs
and Tories.

The rejection of this petition inflamed the minds of both parties more than ever against each other. The obsolete distinction of *Whig* and *Tory* was now revived, and that with such animosity, that Britain itself, as well as America, now seemed in danger of becoming a seat of war and bloodshed. The Tories were accused as the promoters of those sanguinary addresses already mentioned. They were said to be the great misinformers of government; and the false representations they industriously procured from all quarters had contributed more than any thing else to inflame the animosity and produce the civil war. They were upbraided with their attachment to the Stuart family. England, it was said, had, through their machinations, been made a scene of blood in the last century; and had been perpetually tottering on the brink of ruin from the restoration to the revolution. At that time indeed the more sensible part of the nation, wearied out with perpetual attempts to enslave them, took the resolution of expelling an ill advised monarch, whom nothing could prevent from pursuing their pernicious plans to his own ruin. But the Tories were an incorrigible race, who could not be cured even by experience; for though they had seen repeated instances of the mischief attending their plans, they adhered to them with as great obstinacy as if the greatest benefits had on all occasions accrued from them. Dissention at home and disgrace abroad had been the constant attendants of their councils; while the only objects they ever had in view were the establishment and propagation of their own tenets; for these alone they laboured, the honour

and interest of the nation being entirely out of the question. They would willingly sacrifice to the point above mentioned; and as a nuisance of the effects of their councils, the treaty of Utrecht was mentioned. Here, said their antagonists, the fruits of a triumphant war, carried on for twelve years, were lost at once by those seeds which the Tories occasioned through their restless endeavours to compass their insidious projects.

On the other hand, the Tories said that the Whigs were the genuine descendants and representatives of those republican incendiaries who had in the last century overturned the constitution and desolated the kingdom. They pretended indeed to assert the liberty of Britain; but under this pretence they wished to engross all the authority to themselves, as might easily be proved by an impartial examination of their conduct in the unhappy times alluded to. In the present dispute the principal question was, Whether the king and parliament, when united, were to be obeyed or resisted? The Tories insisted, that they were to be obeyed; the Whigs, that they were to be resisted. The truth was, therefore, that there were two parties in Britain; the one of which was of opinion that the colonies owed obedience to Great Britain in all cases whatever, and that in case of refusal they ought to be compelled to obey; but the other, though it acknowledged the same obligation on the colonies, thought it was unadvisable to force it. The only constitutional method of deciding this question was by an appeal to parliament. That appeal had already been made, and parliament had determined on compulsion. The decision ought therefore to be considered as that of the voice of the nation; and were a parliamentary majority to be viewed in any other light, all things would fall into confusion, and no rule of government remain. The doctrines of the Whigs were also said to be inadmissible in sound policy. Authority, sovereign and uncontrolled, must reside somewhere; and allowing every charge of bribery and corruption (which were brought by the other party most liberally) to be true, it were still better to be governed in some instances by such means, than to have no government at all. This must at last be the case were continual appeals to be made to the people; as they would undoubtedly be followed by perpetual broils at home as well as disasters abroad.

To these violent bickerings at home, some very serious commercial misfortunes were now added. It had been represented as very probable, during the last session of parliament, that the bill for depriving the people of New England of the benefits of the Newfoundland fishery, would redound greatly to the interest of Great Britain, by throwing into her hands alone the profits which were formerly divided with the colonies. This expectation, however, proved totally void of foundation. The number of ships fitted out that year was scarcely greater than usual. The Congress had also prohibited them from being supplied with provisions; so that not only those on board the ships, but even the inhabitants on the island of Newfoundland itself, were in danger of perishing. Many of the ships were therefore obliged to go in quest of provisions, instead of prosecuting the business on which they came. On the whole, therefore, instead of any increase, the profits of

594
MISSTUDIES
to New-
foundland
fishery.

Britain. the fishery suffered this year a diminution of near 500,000l. Along with this, some natural causes co-operated, which, by the more superstitious, were considered as the effects of divine wrath. A most violent and uncommon storm took place in these latitudes during the fishing season. The sea rose full 30 feet above its ordinary level; and that with such rapidity, that no time was allowed for avoiding its fury. Upwards of 700 fishing boats perished, with all the people in them; and some ships foundered, with their whole crews. Nor was the devastation much less on shore, as the waters broke in upon the land, occasioning vast loss and destruction.

595
Violent and destructive storm.

596
Intellectual petitions, &c.

By these misfortunes, the general stagnation of commerce, and the little success that had hitherto attended the British arms, the mercantile part of the nation were thrown into despair. Petitions were poured in from all quarters, the contents of which were similar to those already mentioned, and their reception exactly the same. Ministers had determined on their plan; and the only difficulty was, how to put it in execution as quickly as they desired. For this purpose, application was made to the petty states of Germany, who are wont to hire out their forces, and who had frequently sent auxiliaries to Britain in former cases of exigency. At present, however, the scheme met with considerable difficulties, occasioned by the distance, as well as the danger, of the desertion of the mercenaries. The princes were likewise alarmed at the appearance of losing so many subjects for ever; while the latter were no less startled at the proposal of being transported across the ocean into a new world, there to be exposed to all the miseries of war, with very little hope of ever seeing their native country again. Other resources, however, were devised, by calling in the assistance of the Hessians, and obtaining from Holland that body of Scots troops which had been so long in their service. But in both these views administration were disappointed. All the states of Europe looked upon Britain with an invidious eye, though none so much as Holland and France; these being the two powers who had most reason to hope for advantage from the quarrel. A very strong party in Holland contended for the American interest. Pamphlets were daily published at Amsterdam in justification of the colonies: their case was compared with that of the Netherlands in former times; and they were exhorted to persevere in their claims against the pretensions of Britain. Her they represented as insatiably covetous of wealth and power, and desirous of seizing every thing she could. She was also taxed with being of a domineering disposition; and that, since her successes in the war of 1755, she had become intolerable, not only to her neighbours, but to the whole world: nay, that even during the war she had exercised an absolute sovereignty at sea, and did not scruple to avow a right and title to rule over that element.

597
Difficulty of procuring foreign succours.

598
France and Holland espouse the American cause.

But though these powers thus early expressed their hostile disposition towards Britain, it was otherwise with the princes of Hesse and Brunswick; by whom, and some other German princes of inferior note, a considerable number of troops were supplied. At the same time, that as many British forces as possible might be employed, large draughts were made from the garrisons of Gibraltar and Minorca, who were supplied in

599
Auxiliaries obtained from Hesse and Brunswick.

return with an equal number of men from the electorate of Hanover. In justice to the ministers, indeed, it must be owned, that they prosecuted the scheme they had undertaken with all possible vigour; inasmuch that the expences already began to occasion considerable alarm. This was owing, in the first instance, to the bad success of the British arms, which occasioned a demand on this country altogether unlooked for. It had always been supposed, that the British army would be completely victorious; or at least would remain so far masters of the field, that they could easily command what supplies of fresh provisions were necessary. In-

stead of this, they were now cooped up in such a manner as to be actually in danger of perishing for want. The supplies, therefore, of necessity, were sent from Britain; and indeed the exertions for their relief were such as must give high ideas of the opulence and spirit of the British nation. For these troops there were shipped no fewer than 5000 live oxen, 14,000 sheep, with a proportionable number of hogs, immense quantities of vegetables, prepared with all possible care; 10,000 butts of small beer, and 5000 butts of strong beer. Some idea of the expences of these articles may be obtained from an account of what was paid for articles trifling in comparison of the above. For a regiment of light horse in Boston, L. 20,000 were paid for oats, hay, and beans. The articles of vinegar, vegetables, and casks, at no less; and every thing else in proportion. The contingencies occasioned by military operations amounted to near L. 500,000. The prodigious expences, therefore, of maintaining an inconsiderable armament at such a distance, could not fail to give a very unfavourable opinion of the war at large, and justly raise suspicions, that even the treasures of Britain would not be able to defray the expence. One advantage, however, was derived from such immense profusion; the price of every thing was augmented; that of shipping particularly rose one fourth in the ton: and though the profits made by contractors and their numerous friends were complained of, the benefits which accrued to multitudes employed in the various branches of public business seemed in some measure to make amends for every thing.

Misfortune, however, seemed now to attend every scheme in which Britain engaged herself. Some part of it, indeed, in the present case, might be derived from mismanagement. The sailing of the transports was delayed so long that their voyages were lost. They remained for a long time wind-bound; and, after leaving port, met with such stormy weather, that they were tossed to and fro in the channel till most of the live stock they had on board perished. After clearing the coast of England, their progress was retarded by a continuance of bad weather. They were forced by the periodical winds from the coast of America into the ocean. Some were driven to the West Indies, others were captured by American privateers, and only a very few reached the harbour of Boston, with their cargoes quite damaged, so that they could be of little or no use. Notwithstanding the immense supplies above mentioned, therefore, a subscription was set on foot for the relief of the soldiers; as well as of the families of those who died in the service. This was liberal on the whole, though many refused to contribute,

Britain.

bute, from their disapprobation of the cause; and bitter complaints were made of want of economy throughout the whole American department.

All this time the violent animosities between the parties continued; the desire of peace was gradually extinguished on both sides; and the foundation laid of an enmity scarce ever to be extinguished. Each seemed to be seriously of opinion that the other would willingly ruin the nation if possible; a remarkable instance of which was the commitment of Mr Sayre, an engraver in London, to the tower for high treason. The accusation laid against him was no less than that of having formed a design to seize his majesty as he went to the house of lords: but the scheme itself, and the method in which it was to be executed, appeared both so ridiculous, that the prisoner was very soon discharged; after which he commenced a process against lord Rochfort for false imprisonment.

With respect to the parliamentary proceedings during this period, very little can be said, further than that every measure of administration, whether right or wrong, was violently opposed. The employment of foreign troops, and admitting them into the fortresses of Gibraltar and Minorca, were most severely censured, as being contrary to the bill of rights. Administration contended that this bill only forbade the introduction of a foreign military power into the kingdom during peace; but the times were not peaceable, and the introduction of the troops was evidently with a view to quell a rebellion. The force designed for the conquest of America was then declared to be inadequate to the purpose; but it was replied on the part of ministry, that the design was to conciliate, not to conquer. The force (25,000 men) was sufficient to strike terror; and though this should not instantly be produced, conciliatory offers would still be held out after every blow that was struck.

In the mean time the Americans, sensible of the dangerous situation in which they stood, exerted themselves to the utmost to dislodge the British troops from Boston. This being at length accomplished in March 1776, they proceeded to put their towns in the most formidable state of defence; inasmuch that they seem, if properly defended, to have been almost impregnable. This was evident from the repulse of Sir Peter Parker at Charlestown. But they did not exert equal spirit in the defence of New York; where, besides losing the town, they received such a defeat as seemed to threaten their affairs with total ruin. See AMERICA.

In this view it appeared to the generality of the people in Britain. The successful campaign of 1775 was looked upon as so decisive, that little room was left to suppose the Americans capable of ever retrieving their affairs. Opposition were much embarrassed, and now almost reduced to the single argument of the interference of foreign powers, which they had often unsuccessfully used before. Besides this, indeed, the obstinacy of the Americans in refusing the offers of lord Howe, even at the moment of their greatest depression, seemed to be a very bad presage. The strength of ministry, however, now became so decisive, that whatever they proposed was immediately carried. The number of seamen for 1777 was augmented to 45,000, and upwards of five millions voted for the expence of the navy, and to discharge its debt. The expences of

the land-service amounted to near three million; besides the extraordinary expenses of the former year, which amounted to more than L. 1,200,000; and though this vast profusion became the subject of much complaint and animadversion, the power of ministry silenced every opposer.

But however administration might now triumph, their exultation was but of short continuance. The misfortune of general Burgoyne at Saratoga threw the whole nation into a kind of despair, and reduced the ministry to the greatest perplexity. The great difficulty now was to contrive means for raising a sufficient number of forces to carry on the war; but from this they extricated themselves by what must be allowed a masterly contrivance. This was the encouraging levies for government service by cities and private persons; and as the design was kept a profound secret before the Christmas recess, they were not disturbed by the dangerous clamours of opposition. The recess was purposely extended in order to give time for the scheme to take effect; and before parliament met again it was actually accomplished, so that ministers could once more face their opponents without any fear.

Another and more weighty consideration, however, now occurred. The European states in general had long beheld the grandeur of Britain with an envious eye. The news of the disaster at Saratoga was therefore received among them as those of the defeat of Charles XII. at Paltowa was among the powers whom he had so long commanded. Of all these the French, for obvious reasons, were the most active in supporting the Americans. Numbers of the young nobility were eager to signalize themselves in the American cause; and among the rest the marquis de la Fayette, a young nobleman of the first rank and fortune. Impelled by an enthusiastic ardour of the American cause, he purchased a vessel, loaded her with military stores, and sailed in her with several of his friends to America, where he presented his services to congress. From them he met with a most gracious reception, and was invested with a command, in which he lost no opportunity of distinguishing himself. Besides this nobleman, several other officers from France and Germany actually entered the American service, and by their military talents greatly contributed to the exertions which the colonies were afterwards enabled to make.

This assistance, however, would have been but trifling, had not the French court also interceded itself in their behalf; for by the time, or very soon after, the news of general Burgoyne's disaster arrived in Britain, a treaty was on foot between the French court and the United States of America.

Even before this time France had showed such an extreme partiality towards the Americans, as might have plainly indicated their design of ultimately assisting them in their national capacity. The encouragement given to the American privateers in all the ports of France had produced strong remonstrances on the part of Britain; and an order was at last demanded, that all these privateers with their prizes should depart the kingdom. With this they found it necessary to comply at that time, but reprisals could be made by capturing their whole Newfoundland fleet then out on the fishery. So many delays, however, were made on

various pretences, that not a single vessel was dismissed from any of their ports. So far indeed were the French court from any design of this kind, that in the month of July 1777 the whole body of merchants throughout the kingdom were assured from government that they might depend on protection in their trade with America.

All this time the greatest preparations were made throughout the whole kingdom of France for war; so that the most judicious politicians were of opinion that a rupture with that power should have immediately followed the commencement of hostilities with America, and for which the behaviour of the former furnished abundant reasons of justification. Whatever might have been the motives of the British ministry, however, it is certain, that in defiance of probability, even when joined by the most acrimonious censures of opposition, they continued to pretend ignorance of any hostile intentions in the court of France, until that court of its own accord thought proper to announce them. This was done by a formal notification to the court of Britain in the month of March 1778, and that in the most mortifying terms. In this declaration it was announced, not only that a treaty of friendship and commerce was concluded betwixt France and America, but Britain was insulted with being told that America was actually in possession of independency, as if the former had already exerted her utmost efforts without being able to reduce them. A merit was also made of having entered into no commercial stipulations in favour of France exclusive of Britain. Nothing, therefore, could be more offensive; and though it could not decently be said on the part of the French monarch that he wished for war, yet his pacific intentions were conveyed in such haughty terms, that the whole could only be considered as a declaration of those hostilities which he pretended to avoid.

Both parties now united in their opinion that a war with France was unavoidable; but they were not for that reason any farther advanced towards a reconciliation. It must be owned, indeed, that the minority had now, according to their own account, received very great provocation. They had from the beginning reprobated the American war, and prognosticated its bad success. In this they had been over-ruled, and the character of the Americans represented in such a manner as almost to preclude the idea of their being able to resist. They had resisted, however; and by destroying or taking prisoners a whole army, verified those predictions which had been so often treated with ridicule. The popular party had, times without number, insisted in the most earnest manner for some kind of concession towards America; but this had constantly been refused with an unparalleled and inveterate obstinacy. They now saw these very concessions offered to America after the defeat of Burgoyne, which, had they been granted in time, would have prevented all the mischief. Added to all this, the expences for the ensuing year had been hurried through the house before the Christmas vacation; the levies had been raised by subscription without consent of parliament at all; yet both these proceedings had been determined to be strictly legal and constitutional. Every inquiry into the measures of government had been frustrated; and one into the state of the nation in general, which could

not be absolutely rejected, was rendered ineffectual by delays and evasion. Lastly, they now saw their country involved in a foreign war with a nation well provided for all emergencies, while we had supinely suffered them to go on, without making the least effort to put ourselves in a proper state of defence.

For these reasons opposition insisted that the present ministry ought no longer to be trusted with the management of public affairs. An acknowledgment of the independence of America was now by many supposed to be the only rational step that could be taken, which might now be done with a good grace, and which we would unavoidably be obliged to take at last whether we would or not. By acknowledging this independence before they had time to enter into exclusive engagements with France, their trade would be open to all the world. This of course would lessen their correspondence with France, and leave them at liberty to form such connections as they thought most proper. The ministerial party, however, still insisted on vigorous measures, representing it as a spiritless and disgraceful measure to bend beneath the power of France, and setting forth the resources of Great Britain as sufficient to resist the efforts of all her enemies. The dishonour of leaving the American loyalists exposed to the resentment of their countrymen was also set forth in the strongest manner. These, by very intelligent people, were said to be by far the greater number. Were it not more eligible, on the very strength of such an assumption, to make trial of its veracity, and to put arms into their hands? Whatever the danger of the experiment might be, we could not abandon them without exposing our reputation, and losing that character of fidelity to our engagements for which we had hitherto been so justly respected. Unanimity in the present case was strongly, and indeed very justly, insisted upon; but when opposition complained of some occult irresistible influence by which the councils of the nation were directed, in despite of every suggestion of reason and argument, the charge was denied in the strongest manner, and ministers disclaimed every motive of their conduct, excepting that of an internal conviction of its own rectitude.

Notwithstanding the violence of these altercations, however, the greatest courage and steadiness was manifested by the cool and deliberate part of the nation. The French resolved in the first place to excite a general terror by threatening an invasion. This was evidently impracticable, without their procuring first the superiority at sea; yet as multitudes in the country were apt to be terrified by the very mention of a French invasion, orders were issued to draw out and embody the militia, which was then composed of men in every respect as well exercised and disciplined as any regular troops. It was complained, however, that a French squadron of 12 ships of the line had sailed from Toulon, without any obstruction, under the command of the count d'Estaing. The most grievous apprehensions were entertained from the great inferiority of lord Howe's naval force, which might expose him to a total defeat, and the whole fleet of transports to be taken or destroyed by the enemy. But whatever might have been the probabilities in this case, it is certain that either the fortune or conduct

all parts of the world, and at the same time to watch the motion of the French fleet at Brest.

On the arrival of the British fleet off the coast of France, two French frigates approached it, in order to make their observations. These were the *Licorne* of 32 guns and the *Belle Poule* of 26. In consequence of a signal to give chase, the *Milford* frigate overtook the *Licorne* towards the close of the day, and requested the French captain to come under the British admiral's stern; upon his refusal, a ship of the line came up, and compelled him to come into the fleet. Next morning, the *Licorne* seeming by her motions to be altering her course, a shot was fired across her way as a signal for keeping it. Hereupon she discharged a broadside and a volley of small arms into the *America* of 64 guns that lay close to her, and immediately struck. The behaviour of the French captain was the more astonishing, as lord Longford, captain of the *America*, was at that instant engaged in conversation with him in terms of civility; but though such behaviour certainly merited severe chastisement, no hostile return was made.

The *Arethusa* of 26 guns, commanded by captain Maithal, with the *Aleut* cutter, was mean while in pursuit of the *Belle Poule*, that was also accompanied by a schooner, and the chase was continued till they were both out of sight of the fleet. On his coming up, he informed the French captain of his orders to bring him to the admiral, and requested his compliance. This being refused, the *Arethusa* fired a shot across the *Belle Poule*, which she returned with a discharge of her broadside. The engagement thus begun, continued more than two hours with uncommon warmth and fury.

The *Belle Poule* was greatly superior not only in number, but in the weight of her metal: her guns were all 12 pounders; those of the *Arethusa* only six: Notwithstanding this inferiority, she maintained so desperate a fight, that the French frigate suffered a much greater loss of men than the British. The slain and wounded on board the former, amounted, by their own account, to near 100; on board the latter, they were not half that proportion.

Captain Fairfax in the *Aleut*, during the engagement between the two frigates, attacked the French schooner, which being of much the same force, the dispute continued two hours with great bravery on both sides, when she struck to the English cutter.

The *Arethusa* received so much damage, that she became almost unmanageable: the captain endeavoured to put her into such a position, as to continue the engagement; but was unable to do it. Being at the same time upon the enemy's coast, and close on the shore, the danger of grounding in such a situation obliged him to act with the more caution, as it was midnight. The *Belle Poule*, in the mean time, stood into a small bay, surrounded with rocks, where she was protected from all attacks: she had suffered so much, that the captain, apprehending that she could not stand another engagement, had resolved, in case he found himself in danger of one, to run her aground: but her situation prevented any such attempt; and as soon as it was day-light, a number of boats came out from shore, and towed her into a place of safety. Notwithstanding the evident and great superiority on the side

of the French, this action was extolled by them as a proof of singular bravery, and the account of it received with as much triumph as if it had been a victory.

On the 18th of June, the day following the engagement with the *Belle Poule*, another frigate fell in with the British fleet; and was captured by the admiral's orders, on account of the behaviour of the *Licorne*.

The capture of these French frigates produced such intelligence to the admiral, as proved of the utmost importance, at the same time that it was highly alarming. He was informed that the fleet at Brest consisted of 32 ships of the line and 12 frigates. This was in every respect a most fortunate discovery, as he had no more with him than 20 ships of the line and three frigates. The superiority of the enemy being such as neither skill nor courage could oppose in his present circumstances; and as the consequences of a defeat must have been fatal to this country, he thought himself bound in prudence to return to Portsmouth for a reinforcement. Here he arrived on the 27th of June, and remained there till the ships from the Mediterranean, and the Spanish and Portuguese trade, and the summer fleet from the West Indies coming home, brought him a supply of seamen, and enabled him to put to sea again, with an addition of ten ships of the line. But still there was a great deficiency of frigates, owing to the great numbers that were on the American station, and the necessity of manning the ships of the line preferably to all others.

In the mean time, the preparations at Brest being fully completed, the French fleet put to sea on the 8th of July. It consisted of 32 sail of the line, besides a large number of frigates. Count D'Orvilliers commanded in chief. The other principal officers in this fleet were counts Duchaffault, de Guichen, and de Grasse; monsieur de Rochechoart and monsieur de la Motte Piquet. A prince of the blood royal had also been sent to serve on board this fleet; this was the duke of Chartres, son and heir to the duke of Orleans, first prince of the blood royal of France in the collateral line. He commanded one of the divisions in quality of admiral.

On the 9th day of July, the British fleet sailed out of Portsmouth in three divisions; the first commanded by Sir Robert Harland, the third by Sir Hugh Palliser, and the centre by Admiral Keppel, accompanied by Admiral Campbell, an officer of great courage and merit. The French had been informed that the British fleet was greatly inferior to their own; which was but too true at the time when they received this information. Being yet unapprised of the reinforcement it was returned with, the admiral sailed at first in quest of it, intending to attack it while in the weak condition it had been represented to him.

As the British admiral was equally intent on coming to action as soon as possible, they were not long before they met. On the 23d of July they came in sight. But the appearance of the British ships soon convinced the French admiral of his mistake, and he immediately determined to avoid an engagement no less cautiously than he had eagerly sought it before.

Herein he was favoured by the approach of night: All that could be done on the part of the British was to form the line of battle in expectation that the enemy would do the same. During the night the wind changed

Britain.

so favourably for the French, as to give them the weather gage. This putting the choice of coming to action, or of declining it, entirely in their own power, deprived the British admiral of the opportunity of forcing them to engage as he had proposed.

During the space of four days, the French had the option of coming to action; but constantly exerted their utmost care and industry to avoid it. The British fleet continued the whole time beating up against the wind, evidently with a resolution to attack them. But notwithstanding the vigour and skill manifested in this pursuit, the British admiral had the mortification to see his endeavours continually eluded by the vigilance and precaution of the enemy not to lose the least advantage that wind and weather could afford.

The chase lasted till the 27th of July. Between ten and eleven in the morning, an alteration of wind and weather occasioned several motions in both fleets that brought them, unintentionally on the part of the French, and chiefly through the dexterous management of the British admiral, so near each other, that it was no longer in their power to decline an engagement. Both fleets were now on the same tack: had they so remained, the British fleet on coming up with the French would have had an opportunity of a fair engagement, ship to ship; which would hardly have failed of proving very decisive: but this was a manner of combatting quite contrary to the wishes of the French admiral. Instead of receiving the British fleet in this position, as soon as he found that an action must ensue, he put his ships on the contrary tack, that, sailing in opposite directions, they might only fire at each other as they passed by. By this means a close and sidelong action would be effectually evaded. As soon as the van of the British fleet, consisting of Sir Robert Harland's division, came up, they directed their fire upon it; but at too great a distance to make any impression: the fire was not returned by the British ships till they came close up to the enemy, and were sure of doing execution. In this manner they all passed close alongside each other in opposite directions, making a very heavy and destructive fire.

The centre division of the British line having passed the rearmost ships of the enemy, the first care of the admiral was to effect a renewal of the engagement, as soon as the ships of the different fleets, yet in action, had got clear of each other respectively. Sir Robert Harland, with some ships of his division, had already tacked, and stood toward the French; but the remaining part of the fleet had not yet tacked, and some were dropped to leeward, and repairing the damages they had received in the action. His own ship the *Victory* had suffered too much to tack about instantly; and had he done it, he would have thrown the ships astern of him into disorder. As soon as it was practicable, however, the *Victory* wore, and steered again upon the enemy before any other ship of the centre division; of which not above three or four were able to do the same. The other ships not having recovered their stations near enough to support each other on a renewal of action, in order to collect them more readily for that purpose, he made the signal for the line to battle ahead. It was now three in the afternoon; but the ships of the British fleet had not sufficiently regained their stations

to engage. The *Victory* lay nearest the enemy, with the four ships above mentioned, and seven more of Sir Robert Harland's division. These twelve were the only ships in any condition for immediate service; of the others belonging to the centre and to Sir Robert Harland's division, three were a great way astern, and five at a considerable distance to leeward, much disabled in their rigging.

Sir Hugh Palliser who commanded the rear division during the time of action, in which he behaved with signal bravery, came of course the last out of it; and in consequence of the admiral's signal for the line, was obliged to have led the van on renewing the fight; but his division was upon a contrary tack, and was chiefly out of the line. The French, on the other hand, expecting directly to be re-attacked, had closed together in tacking, and were now spreading themselves into a line of battle. On discovering the position of the British ships that were fallen to leeward, they immediately stood towards them, in order to cut them off. This obliged the admiral to wear and to steer ahead the enemy's foremost division, in order to secure them; directing, at the same time, Sir Robert Harland to form his division in a line astern, in order to face the enemy till Sir Hugh Palliser could come up, and enable him to act more effectually.

The admiral, in moving to the protection of the leeward ships, was now drawing near the enemy. As Sir Hugh Palliser still continued to windward, he made a signal for all the ships in that position to come into his wake: Sir Hugh Palliser repeated this signal; but it was unluckily mistaken by the ships of his division as an order to come into his own wake, which they did accordingly; and as he still remained in his position, they retained theirs of course.

Sir Robert Harland was now directed to take his station ahead, and the signal repeated for Sir Hugh Palliser's division to come into his wake; but this signal was not complied with, any more than a verbal message to that purpose, and other subsequent signals for that division's coming into its station in the line, before it was too late to recommence any operations against the enemy.

In the night, the French took the determination to put it wholly out of the power of the British fleet to attack them a second time. For this purpose, three of their swiftest sailing vessels were fixed in the stations occupied during the day by the three admiral ships of the respective divisions, with lights at the mizzen, to deceive the British fleet into the belief that the French fleet kept its position with intent to fight next morning. Protected by this stratagem, the remainder of the French fleet drew off unperceived and unsuspected during the night, and retired with all speed towards Brest; they continued this retreat the whole course of the following day, and entered that port in the evening. Their departure was not discovered till break of day; but it was too late to pursue them, as they were only discernible from the mizzen-heads of the largest ships in the British fleet. The three ships that had remained with the *Victory* were pursued; but the vessels that chased them were too disabled to overtake them from the damages they had received in the preceding day's engagement, that they were quickly ob-

Britain.

Britain.

called; and the admiral made the best of his way to Plymouth, as being the nearest port, in order to put his fleet into a proper condition to return in quest of the enemy.

The killed and wounded on board the British fleet amounted to somewhat more than 500; but the French, it has been asserted on grounds of great credibility, lost 3000. This appears the less improbable, from the consideration that the French, in all their naval engagements, aim principally at the mast and rigging, and the British chiefly at the body of the ships.

622
Subsequent
declarations,
at a trial of
the admiral

This action, whatever might have been the merit of the commanders, proved a source of the most fatal animosities. The bulk of the nation had so long been accustomed to hear of great and glorious victories at sea, that it was supposed a kind of impossibility for a French and British fleet to encounter without the total ruin of the former. The event of the last engagement, therefore, became an object of very severe criticism; and complaints were made, that, through the bad conduct of the blue division, an opportunity had been lost of gaining a complete victory over the French fleet. These complaints were quickly introduced into the public papers; and were carried on with a warmth and vehemence that set the whole nation into a ferment of the most violent and outrageous nature. The friends of Sir Hugh Palliser, the vice admiral of the blue, were no less violent in the defence of his conduct than his opponents were in its condemnation; while those who espoused the cause of the admiral, manifested no less determination in accusing him of being the real cause of the escape of the French fleet, through his disobedience of the signals and orders of his commander, and by remaining at a distance with his division, instead of coming to the assistance of the rest of the fleet.

An accusation of so weighty a nature very much alarmed Sir Hugh Palliser. He therefore applied to admiral Keppel for a justification of his conduct; and required of him to sign and publish a paper relative to the engagement of the 27th of July; therein specifying as a fact, that he did not intend by his signals on the evening of that day to renew the battle then, but to be in readiness for it the next morning.

On the rejection of this demand, Sir Hugh Palliser published in one of the daily papers a variety of circumstances concerning that engagement; reflecting severely on the conduct of the admiral, and prefacing the whole by a letter signed with his name.

An attack so public, and so detrimental to his character, induced admiral Keppel to declare to the admiralty, that unless Sir Hugh Palliser should explain this matter to his satisfaction, he could not, consistently with his reputation, ever act conjointly with him.

This altercation happening before the meeting of parliament, was of course taken notice of when it met. In the house of peers an inquiry was demanded into the conduct of the commanders of the fleet on the 27th of July, on account of the declaration of admiral Keppel, that he would not resume the command until such an inquiry had taken place.

In the house of commons also it was urged, that as admiral Keppel had expressed a public refusal to serve in conjunction with Sir Hugh Palliser, the cause of such a declaration ought to be investigated. Admiral Keppel and Sir Hugh Palliser, who were both present

Britain.

in the house on this occasion, spoke severally to the point in question in support of their respective conduct. The issue of the contest between them was, that a motion was made for an address to the Crown to bring Sir Hugh Palliser to a trial for his behaviour in the late engagement with the French fleet. In answer to this motion, Sir Hugh Palliser replied, in a speech of great warmth and vehemence, that he had already demanded and obtained a court-martial to sit on admiral Keppel, whom he charged with having through his misconduct caused the failure of success in that engagement.

This intelligence was received with great astonishment in the house. It had been, and still continued to be, the general desire of individuals of all parties, to heal this breach between the two officers at a time when the services of both were so much needed. It was therefore with universal concern the house was informed of the determination that had been taken to bring admiral Keppel to a trial. The admiral, however, conducted himself on this occasion with remarkable temper and coolness of expression. He acquiesced without reluctance in the orders that had been laid upon him to prepare for a trial of his conduct; which he hoped would not, upon inquiry, appear to have been dishonourable or injurious to his country, any more than disgraceful to himself.

The conduct of the board of admiralty in admitting the charges against admiral Keppel, and appointing a trial, was greatly condemned in the house. It was said to have been their duty to have laboured with the utmost earnestness, and exerted their whole official influence, to stifle this unhappy disagreement between two brave and valuable men; the consequences of which they well knew, and ought to have obviated, by interposing as reconciliators, instead of promoting the dispute, by consenting to bring it to a judicial and public hearing. On the other hand, it was answered, that they could not, consistently with the impartiality which they owed to every officer of the navy, refuse to receive all matters of complaint relating to subjects of their department. They had no right to decide on the merits of any case laid before them, but were bound to refer it to a court composed of naval officers, who were the only proper and competent judges of each others conduct in professional matters. In conformity with these principles, which were founded upon the clearest equity, they left the decision of the present altercation to the gentlemen of the navy; whose honour and integrity in all instances of this kind had never been called in question, and by whose verdict alone it was but just and reasonable that every officer in that line of service should wish to stand or fall.

The arguments upon this subject were urged with great heat and violence on both sides. They produced uncommon animosity and rancour, and gave rise to a spirit of contention that diffused itself through all classes of society. Such was the height of passion that prevailed every where, that the critical circumstances of the nation were wholly forgotten, and the attention of the public entirely absorbed in this fatal dispute. Individuals of all ranks and all professions engaged in it with as much zeal as if they had been personally concerned in the issue. The dissatisfaction that was excited upon this occasion among the upper classes in the navy, appeared in a memorial presented to the king

Britain.

Britain.

by twelve of the oldest and most distinguished admirals, at the head of whom was the name of lord Hawke. The conduct of Sir Hugh Palliser was therein condemned without reserve; that of the admiralty itself was severely censured, as having established a precedent pregnant with the most ruinous consequences to the naval service of the kingdom. By the measure it had now adopted, that board had submitted to become the instrument of any individual who might be prompted by iniquitous motives to deprive the navy of its best and highest officers. It was a destructive violation, they said, of all order and discipline in the navy, to permit and countenance long concealed, and afterwards precipitately adopted charges, and recriminatory accusations of subordinate officers against their commanders in chief. It was no less improper and scandalous, to suffer men at once in high civil office, and in subordinate command, previous to their making such accusations, to attempt to corrupt the judgment of the public, by publishing libels on their officers in a common newspaper, which tended at once to excite dissensions in the navy, and to prejudice the minds of those who were to try the merits of the accusation against the superior officer.

It was remarkable in this memorial, that the majority of those who subscribed it were not only officers of the first rank and importance in the navy, but unconnected with the opposition, and attached by various motives to the court and ministry. This evinced their conduct in the present instance to have been uninfluenced by considerations of party.

No business of any consequence was agitated in either of the houses of parliament while the trial continued. It began upon the 7th of January 1779, and lasted more than a month, not ending till the 11th day of February ensuing. After a long and accurate investigation of every species of evidence that could be produced, the court-martial acquitted admiral Keppel of all the charges that had been brought against him in the most complete and honourable manner. He was declared to have acted the part of a judicious, brave, and experienced officer; and the accusation was condemned in the most severe manner.

Both houses of parliament voted him their thanks for the eminent services he had performed, and the whole nation resounded with his applause. The city of London bestowed every honour and mark of respect in its power upon admiral Keppel; while the resentment against his accuser was so strong, that it constrained him to retire wholly from public life, and to resign all his employments.

But notwithstanding the high degree of national favour and esteem in which admiral Keppel now stood, he thought it prudent to withdraw from a situation wherein he found himself not acceptable to those in power, by resigning his command.

The conduct of those who presided at the admiralty board now became an object of severe censure; and a number of facts were cited to prove that its conduct for many years past had been highly reprehensible. The debates were uncommonly violent; and the resolution to condemn the conduct of the admiralty was lost only by a majority of 34. Administration, however, still kept their ground; for though a second attempt was made to show that the state of the navy was

inadequate to the vast sums bestowed upon it, the point was again lost by much the same majority. The argument used by the ministry in defence of their conduct in this case was, that the ships now constructed were of a much larger size, and consequently much more expensive than formerly. But however they might be victorious in argument, it is certain that the conduct of the admiralty was very far from giving general satisfaction at present. Not a lord admiral Keppel, but lord Howe, declared his resolution to relinquish the service while it continued under the direction of its managers at that time. Their resignation was followed by that of Sir Robert Harland, Sir John Lushay, and several others; nay, so general was the dislike to the service now become, that not fewer than 20 captains of the first distinction had proposed to go in a body to resign their commissions at once; and were prevented from doing so only by the great occasion they saw there was at that time for their services.

This extreme aversion to the service produced a direct attack upon Lord Sandwich, at that time first lord of the admiralty. But though in this as well as other cases the ministry were still victorious, they could not prevent an inquiry into the cause of our want of success in the American war. This was insisted upon by lord and general Howe, whose conduct had been so much reflected upon, that a vindication was become absolutely necessary. The inquiry was indeed very disagreeable to administration, and therefore evaded as long as possible. From the evidence of lord Cornwallis and other officers of high rank, however, it appeared that the forces sent to America were not at any time sufficient to reduce it; that the Americans were almost universally unfriendly to the British cause; and that the nature of the country was such, that the conquest of it must be excessively difficult. It appeared also, that the camp of the Americans on Long Island was so strong, that it could not have been attacked with any probability of success, after their defeat in 1776, without artillery and other necessary preparations. In every instance, therefore, the general's conduct was shown to have been the most eligible and judicious possible. These facts, however, being directly opposite to what the ministry wished to appear, counter evidence was brought in, with a view to invalidate the testimony of the very respectable witnesses above mentioned. In this business only two were examined, viz. major-general Robertson, and Mr Joseph Galloway an American gentleman. From the evidence of Mr Galloway especially, it appeared, that the conduct of general Howe had not been unexceptionable; that the greater part of the Americans were friendly to the cause of Britain; that the country was not full of obstructions as had been represented; woods and forests being no obstructions to the marching of armies in as many columns as they pleased; that soldiers might carry provisions for 19 days on their backs, &c.

Though no tricks could be laid up in such extravagant assertions proceeding undoubtedly from ignorance, yet they fully answered the purpose of ministry at this time, viz. procrastination, and preventing the disagreeable truths above-mentioned from striking the minds of the public too sensibly. The event of this inquiry, however, encouraged general Burgoyne to insist on an examination of his conduct; which indeed had been

Britain. so unmercifully censured, that even the ministers began to think he had suffered too much, and that he ought to be allowed to vindicate himself. He was accordingly permitted to bring witnesses in his own behalf; and from the most respectable evidence it appeared that he had acted the part, as occasion required, both of a general and soldier; that the attachment of his army to him was so great, that no dangers or difficulties could shake it; and that, even when all their patience and courage were found to be ineffectual, they were still ready to obey his commands, and die with arms in their hands. A great number of other particulars relating to his expedition were also cleared up entirely to the honour of the general, and several charges against him were totally refuted. It appeared, however, that the Americans, far from being the contemptible enemy they had been called, were intrepid and resolute. On the whole, it was remarked by a great number of the most judicious people in the nation, that the spirit of defamation, which for some time had been so prevalent, must at last produce the most fatal effects; by depriving the nation of its best officers, through the aversion that would be produced in them, both in the sea and land departments, to enter into a service where they were certain of being calumniated.

627
Accession of Spain to the confederacy against Britain.

After the resignation of admiral Keppel, the command of the Channel fleet was bestowed, though not without violent debates, on Sir Charles Hardy, a brave and experienced officer, but now advanced in years, and who had retired from the service with a design of never returning to it, being at that time governor of Greenwich hospital. The choice of an admiral to command this fleet was now of the greater importance on account of the accession of Spain to the general confederacy which took place this year*. The quarrel, like that with France, was formally intimated by the Spanish minister on the 17th of June 1779; and like that also was attended with new but ineffectual proposals of an accommodation with America, and removal of the ministry. The imminent danger, however, to which the nation was now exposed, required a vigorous exertion, and various projects for its internal defence were laid before the parliament. The principal of these were the raising of volunteer companies to be added to the regiments of militia belonging to the counties where they were raised, and the augmenting the number of militia. The latter was judged unadvisable, on account of the necessity there would be to send a great number of regular forces out of the kingdom, which would require new supplies of recruits; and the increase of the militia might prove detrimental to the recruiting service. The spirit and magnanimity displayed on this occasion, however, did the highest honour to the national character, and fully justified the opinion generally entertained of its opulence and valour. All parts of the kingdom seemed actuated by a laudable zeal to concur in every measure necessary for its defence; large sums were subscribed by people of rank and affluence; and companies were raised, and regiments formed, with such alacrity as quickly banished all apprehensions for the safety of the kingdom.

628
Schemes for the internal defence of the nation.

On the other hand, the French, now thinking themselves secure of victory by the accession of the whole strength of Spain to their cause, began to extend their plans of conquest. A squadron was fitted out under

the command of the marquis de Vadreuil, destined to reinforce the fleet commanded by D'Estaing. But before its proceeding thither, an attack was made on the British settlements on the rivers Senegal and Gambia in Africa. These were easily conquered; and on this occasion the French quitted their own island of Goree, which was very soon after taken possession of by Sir Edward Hughes in his way to the East Indies. These unimportant and distant conquests, however, being insufficient to produce any great eclat, it was resolved to strike a blow nearer home, by the conquest of Jersey and Guernsey. An attempt was accordingly made; but with so little success, that not a single man could be disembarked on the island they intended to conquer. The enterprize, however, proved indirectly of great service to the cause of America. A fleet of 400 merchantmen and transports were at that time on the point of sailing for New York, under the conduct of admiral Arbuthnot; but that officer, being informed of the attack on Jersey, thought it his duty to come to the assistance of the island rather than proceed on his voyage. This delay was followed by another, occasioned by bad weather; so that the fleet, which was laden with warlike stores and necessaries, did not arrive till the end of August, and several important enterprizes projected by Sir Henry Clinton were of course laid aside.

Britain.
631
Unsuccessful attempt on Jersey.

The French, in the mean time, determined to make a second attempt on Jersey; but their squadron, being attacked by another under Sir James Wallace, was driven ashore in a small bay on the coast of Normandy, under cover of a battery. Thither they were pursued by the British commander, who silenced the battery, took a large frigate of 34 guns, with two rich prizes, and burned two other frigates and several other vessels.

632
French Squadron of frigates destroyed by Sir James Wallace.

Thus disappointed in their attempt on Jersey, a project was formed of invading Great Britain itself; and the preparations for it, whether serious or not, were so formidable, that they very justly excited a considerable alarm in this country. Not only were the best troops in the French service marched down to the coasts of the British channel, but transports were provided in great numbers, and many general officers promoted; the commanders also who were to have the charge of this important expedition were named by government. A junction was formed betwixt the French and Spanish fleets, in spite of the endeavours used on the part of the British to prevent it; and then the allies made their appearance in the British seas with upwards of 60 ships of the line, besides a vast number of frigates and other armed vessels.

633
Invasion of Great Britain projected.

634
Formidable appearance of the combined fleets.

All this formidable apparatus, however, ended in nothing more than the taking of a single ship, the Ardent, of 64 guns. They had passed the British fleet under Sir Charles Hardy in the mouth of the channel without observing him. Sailing then along the coast of England, they came in sight of Plymouth, where they took the Ardent, as has been already mentioned; after which they returned, without making the least attempt to land any where. The British admiral made good his entrance, without opposition, into the channel, on their quitting it, which a strong easterly wind obliged them to do. He endeavoured to entice them up the channel in pursuit of him; but the

635
They take only a single ship.

tain. the great sickness and mortality on board their ships, as they gave out, obliged them to retire, in order to repair their ships, and recruit the health of their people. Thus ended the first, and indeed the greatest exploit performed by the combined fleets in the British seas. An annual parade of a similar kind was afterwards kept up, which was as formally opposed on the part of the British; but not the least act of hostility was ever committed by either of the channel fleets against each other.

Though this ill success, or rather pusillanimity, manifested in the conduct of the combined fleets, was such that the French themselves were ashamed of it, the appearance of them in the channel furnished opposition with abundance of matter for declamation. All ranks of men, indeed, now began to be wearied of the American war; and even those who had formerly been the most sanguine in defence of coercive measures, now began to be convinced of their inutilty. The calamitous effects produced by the continuation of these measures, indeed, had by this time rendered the far greater part of the people exceedingly averse to them; and the almost universal wish was, that the oppressive burden of the American war should be cast off, and the whole national strength exerted against those whom, on account of our frequent contels with them, we had been accustomed to call our natural enemies. For this purpose the national spirit continued to be exerted with unabated vigour. Large sums were subscribed in the several counties, and employed in raising volunteers, and forming them into independent companies; associations were also formed in the towns, where the inhabitants bestowed a considerable portion of their time in training themselves to the use of arms. The East India company now forgot their quarrel with ministry, and not only presented government with a sum sufficient for levying 6000 seamen, but at its own cost added three 74 gun ships to the navy. Administration were not yet, however, weary of the plans they had laid down, and which they seemed inclined to prosecute, and indeed did prosecute, as long as the nation would support them. The virulence of opposition, therefore, still continued; and what was worse, every part of the kingdom seemed to imbibe their sentiments.

Among other charges now brought against them was that of misapplying the national force. An hundred thousand men were employed for the internal defence of the kingdom; which being much more than sufficient for the purpose, ought therefore to have been distributed into places where it might have acted to advantage. The army of Great Britain, it was said, now amounted to 300,000 men; the navy to 300 sail, including frigates and armed vessels; twenty millions had been expended on the service of the year 1779; and yet, with all this force and treasure, the utmost boast that ministers could make was, that the enemy had been hitherto kept at bay, and not allowed to invade Great Britain. Nor were the charges less heavy in other respects. Veteran officers had been passed by to make room for those of inferior merit. The discontented and miserable state of Ireland, the losses of the West India islands, &c. were all put to the account of ministers; and it was said that the universality of the nation was for their dismissal. Their incapacity was now visible to every body; and it was a

matter of universal surpris how they durst resort to such places in opposition to the general desire of the nation.

To all this ministry replied in a resolute and determined manner, denying or refusing every accusation; and at last, after violent debates, gained their point of an address without any amendment proposing their removal, in the upper house by 82 to 41, and in the lower by 253 to 134. The enormous expences already incurred, however, and hereafter to be incurred, for the carrying on of the war, occasioned such a general alarm, that it was no longer possible to refuse compliance with some scheme of economy, or at least giving it a patient hearing. The duke of Richmond proposed that the crown should set the example, and moved for an address to this purpose: but the motion was lost by 77 to 36. The earl of Shelburne next undertook the discussion of the subject; and having, in a most elaborate speech, compared the expences of former times with the present, and shown the immense disparity, he proceeded to show the reasons. These were, that ministers formerly employed fewer persons, and obliged them to be content with smaller profits. One contractor supplied all the troops in America during the last war, and his agreement was to furnish a ration of provisions at fixpence; but so different was the management now, that the ration of provisions, instead of fixpence, cost two shillings. One person only had enjoyed contracts to the amount of 1,300,000 l.; 3,700,000 l. had passed through the hands of another contractor to be transmitted to America: but no voucher had been given for the expenditure of this immense sum; the accounts being contained in a few lines, accounting for 20,000 l. in one line, 30,000 l. in another, &c. Thus, he said, the ministry acquired a most unbounded and unconstitutional influence; and having the dangerous power of expending the national treasure without any check, corruption and venality every where abounded. He moved, therefore, that the expenditure of those vast sums annually sunk in extraordinary should be brought under some control; and that to extend the public expences beyond the sums granted by parliament, was an invasion of its peculiar and exclusive rights.

Though this motion of the earl of Shelburne, and some others of a similar tendency, were rejected on solid principles according to the majority, the minds of the people were far from being consolidated to their views. Instead of this, the opinion began to be so general, that ministers exercised an unconstitutional influence over the representatives, and that such influence was very much augmented within these few years, it was now supposed by numbers of people, that nothing short of a change in the constitution of parliament could remedy the evil complained of. To this purpose a petition was framed in the city of York, on the 30th of December 1779, where a number of the most respectable people in the county had assembled, and delegated 60 gentlemen to carry on to manage the correspondence necessary for carrying on the design, and forming an association to support and promote it. In the present petition it was set forth, that, in consequence of the war in which the nation was involved, the public debt was nearly a hundred times increased, and trade and manufactures much less

Britain. feated. The profusion attending the war was complained of; and parliament was requested, previous to the raising of any new taxes, to inquire into, and correct the abuse of expenditure in the public money; to reduce exorbitant emoluments, abolish sinecure places and unmerited pensions, and apply the produce to the exigencies of the state. This petition was followed by others of a similar kind from 27 of the principal counties, and most of the large towns in England. The most severe and opprobrious language was used in the county-meetings with regard to the ministry and parliament. The latter were represented as void of all principle, ready to sacrifice both conscience and reputation to the will of those in power; and, in short, bound by no ties but those of the most sordid interest; ready on all occasions to enrich themselves by the spoils of their country; and persons to whom the honour or interest of the kingdom were matters of no consideration. The court, on the other hand, was looked upon as the receptacle of every one who harboured ill designs against the people of Britain, and where no body stood any chance of advancing himself but by adulation and extreme servility.

The emissaries of America and the other enemies of Great Britain are said to have been active in fomenting these discords, which at this period arose to an height unknown for a century past. The ministry, however, continued firm and undaunted. Previous to the taking any of the petitions into consideration, they insisted on going through the business of the supply, by determining the ways and means; nor did either the number of English petitions, or an additional one from the island of Jamaica setting forth the extreme danger that island was in, make them alter their resolution in the least.

641
Mr Burke's
plan of pa-
liamentary
independ-
ence and
economy.

At last, in the beginning of February 1780, a plan was brought forward by Mr Burke, for securing the independency of parliament, and introducing economy into the various departments of government. This plan, among other things, proposed the abolition of the offices of treasurer, comptroller, and cofferer of the household; treasurer of the chamber, master of the household, the board of green cloth, with several other places under the steward of the household; the great and removing wardrobe, the jewel office, the robes, board of works, and the civil branch of the board of ordnance. Other reformations were also proposed; but though the temper of the times obliged the minister to admit the bills, and even to pretend an approbation of the plan, he meant nothing less than to admit it in its full extent, or indeed in any part, if it could possibly be prevented. When the plan, therefore, which he had approved in general, came to be particularly considered, he was found to be determined against every part of it. The general temper of the people, without doors, however, seemed now to have affected many of the members of parliament, and made them desert their old standard. An economical plan proposed in the house of lords by the earl of Shelburne was rejected only by a majority of 101 to 55. This was the strongest opposition that had appeared in that house for many years; but in the lower house matters still went worse. The first proposition in Mr Burke's plan was to abolish the office of secretary of state for the colonies; and the utmost efforts of administration

could preserve this office only by a majority of 208 to 201. The board of trade was abolished by 207 to 198: but this was the only defeat sustained by ministry at present; all the rest of the plan being rejected excepting only one clause, by which it was determined that the offices of lieutenant and ensign, &c. belonging to the yeomen of the guards, should not any longer be sold, but given to officers in the army and navy on half pay, and of 15 years standing in their respective lines of service.

This ill success was very mortifying to Mr Burke, who had expected to save more than a million annually to the nation. Administration, however, had still a greater defeat to meet with than what they had experienced in the abolition of the board of trade. The 6th of April was the day appointed for taking into consideration the numerous petitions, from half the kingdom of England, already mentioned. They were introduced by Mr Dunning; who, in a very elaborate speech, set forth the many attempts that had been made to introduce reformation and economy into the plans of government. These had been defeated by ministerial artifice, or overthrown by mere dint of numbers: he concluded therefore, and moved as a resolution of the house, That the influence of the crown had increased, was increasing, and ought to be diminished. This motion being carried after a long and violent debate, he next moved, that the house of commons was as competent to examine into and correct abuses in the expenditure of the civil list as in any other branch of the public revenue. To this another was added by Mr Thomas Pitt, that it was the duty of the house to provide an immediate and effectual redress of the abuses complained of in the petitions. The ministry now requested that nothing farther might be done that night: but such was the temper of the house, that both these motions were carried without a division; after which they were read a first and second time, and agreed to without a division.

Ministry had never received such a complete defeat, nor ever been treated with so much asperity of language. The news of the proceedings of this day were received by the people at large with as much joy as if the most complete victory over a foreign enemy had been announced. Opposition, however, though masters of the field at present, did not imagine they had obtained any permanent victory, and therefore resolved to make the most of the advantages they had gained. It was moved by Mr Dunning at the next meeting, that to ascertain the independence of parliament, and remove all suspicions of its being under undue influence, there should, every session, seven days after the meeting of parliament, be laid before that house an account of all the sums issued out of the civil list, or any other branch of the revenue, since the last recess, in favour of any of its members. This passed with little difficulty; but when he moved that the treasurers of the chamber and household, the cofferer, comptroller, and master of the household, with the clerks of the green cloth, and their deputies, should be excluded from having seats in the house, a warm debate ensued; and the motion was carried only by 215 against 213. This was the last triumph of the popular party; their next motion, for the exclusion of revenue officers, being thrown out by 224 against 195. A last effort was made by Mr Dunning's proposal of an ad-
drefs

citam. dress to the throne against proroguing or dissolving the parliament, until measures had been taken to prevent the improper influence complained of in the petitions. On this occasion the debates were long and violent; but the motion was lost by 254 against 203. Ministry would gladly have screened their friends from the vengeance of opposition; alleging the lateness of the hour, it being then past midnight. The speaker of the house, however, perceiving Mr Fox about to rise, insisted that the house should remain sitting; and thus the deserters from the popular party were condemned to hear their conduct set forth in such terms as perhaps were never applied on any other occasion to members of the British senate.

644
adful
disturbance
account
the pop-
bill.

This last victory of administration confirmed the dissatisfaction and ill opinion which the people had conceived of the majority of their representatives. It was in the height of that ill temper which the conduct of parliament had created in the multitude, that those discontents broke out which were so near involving the kingdom in universal desolation. The hardships under which individuals professing the Roman Catholic persuasion had laboured for many years in England, had lately awakened the consideration of the liberal minded. The inutility and impropriety of persecuting people from whom no danger was apprehended, and who were not suspected of disaffection to the civil constitution of this country, induced several persons of rank and influence to undertake the procuring them relief.

The calamities of the times had afforded the English Roman Catholics a very proper occasion to manifest their attachment to government. They presented a most loyal and dutiful address to the king, containing the strongest assurances of affection and fidelity to his person and the civil government of this country.

“ Our exclusion (said they) from many of the benefits of that constitution, has not diminished our reverence for it. We behold with satisfaction the felicity of our fellow-subjects; and we partake of the general prosperity which results from an institution so full of wisdom. We have patiently submitted to such restrictions and discouragements as the legislature thought expedient. We have thankfully received such relaxations of the rigour of the laws, as the mildness of an enlightened age, and the benignity of the British government have gradually produced; and we submissively wait, without presuming to suggest either time or measure, for such other indulgence as those happy causes cannot fail in their own season to elicit.

“ We beg leave to assure your majesty, that our dissent from the legal establishment in matters of religion is purely conscientious; that we hold no opinions adverse to your majesty's government, or repugnant to the duties of good citizens; and we trust that this has been shown more decisively by our irreproachable conduct for many years past, under circumstances of public discountenance and displeasure, than it can be manifested by any declaration whatever.

“ In a time of public danger, when your majesty's subjects can have but one interest, and ought to have but one wish and one sentiment, we think it our duty to assure your majesty of our unreserved affection to your government, of our unalterable attachment to the cause and welfare of this our common country, and our utter detestation of the designs and views of any foreign

power against the dignity of your crown, and the safety and tranquillity of your subjects.

“ The delicacy of our situation is such, that we do not presume to point out the particular means by which we may be allowed to testify our zeal to your majesty, and our wishes to serve our country; but we entirely leave faithfully to assure your majesty, that we shall be perfectly ready, on every occasion, to give such proofs of our fidelity, and the purity of our intentions, as your majesty's wisdom and the sense of the nation shall at any time deem expedient.”

This address was presented to the king on the first day of May 1778, and was signed by the Duke of Norfolk, the earls of Surrey and Shrewsbury, the lords Stourton, Petre, Arundel, Dormer, Teynham, Clifford, and Linton; and by 163 commoners of rank and fortune.

The only obstacle that stood in the way of their wishes was, the difficulty of overcoming the prejudices of the lower classes, who would probably disapprove and condemn the indulgence shown to the people of a persuasion which they had been taught to look upon with horror and detestation. But notwithstanding the prepossessions of the vulgar, it was determined by several individuals of generous and liberal sentiments, to espouse their cause as far as it could be done consistently with the principles of the constitution and the general temper of the times. Their being patronised by some of the principal leaders in opposition, was a circumstance greatly in their favour; as it showed that those who professed to be the most strenuous friends to the freedom and constitution of this country, did not imagine they would be endangered by treating the Roman Catholics with more lenity than they had hitherto experienced.

About the middle of May, Sir George Saville made a motion for the repeal of some penalties enacted against them. He grounded his motion on the necessity of vindicating the honour and asserting the true principles of the Protestant religion, of which the peculiar merit was to admit of no persecution. It ill became the professors of such a religion to be guilty of that intolerance with which they reproached others. The statutes he meant to repeal were such as gave occasion to deeds that debased and were a disgrace to human nature, by inciting relations to divest themselves of the feelings of humanity, and by encouraging the rapacity of infidellers.

He represented the address above quoted as a full proof of the loyal disposition of the Roman Catholics, and as an unfeigned testimony of the soundness of their political principles. In order, however, to silence the objections of those who might suspect them of duplicity, a bill was proposed of so binding and solemn a nature, that no man could be supposed to imagine that any authority could annul its efficacy.

The pains and penalties of the statutes to be repealed were laid before the house by Mr Dunning. By these statutes it was made felony in a foreign clergyman of the Roman communion, and high treason in one that was a native of this kingdom, to teach the doctrine or perform divine service according to the rites of that church; the estates of persons educated abroad in that persuasion were forfeited to the next Protestant heir; a son or any other nearest relation, be-

Britain. ing a Protestant, was empowered to take possession of his own father's, or nearest of kin's estate, during their lives; a Roman Catholic was disabled from acquiring any legal property by purchase.

The mildness of the British government did not indeed countenance the practice of the severities enacted by these statutes: but still the prospect of gain subjected every man of the Roman persuasion to the ill usage of informers; as on their evidence the magistrates were bound, however unwilling, to carry these cruel laws into execution.

In consequence of these representations, the motion made in favour of the Roman Catholics was received without one dissenting voice; and a bill in pursuance to its intent was brought in and passed both houses. The test or oath by which they were bound, was conceived in the strongest and most expressive terms. They were enjoined to swear allegiance to the king's person and family, and to abjure especially the pretensions to the crown assumed by the person called *Charles III.* They were to declare their disbelief and detestation of the following positions: That it is lawful to put individuals to death on pretence of their being heretics; that no faith is to be kept with heretics; that princes excommunicated by the pope and council, or by the see of Rome, or any other authority, may be deposed or murdered by their subjects or by any others; that the pope of Rome, or any other foreign prelate or sovereign, is intitled to any temporal or civil jurisdiction or pre-eminence, either directly or indirectly, in this kingdom. They were solemnly to profess, that they made the aforesaid declarations with the utmost sincerity, and in the strictest and plainest meaning of the words and language of the test, without harbouring any secret persuasion that any dispensation from Rome, or any other authority, could acquit or absolve them from the obligations contracted by this oath, or declare it null and void.

The indulgence shown to the Roman Catholics in England, encouraged those of the same persuasion in Scotland to hope for a similar relief. Several gentlemen of that nation of great rank and character, and who were members of parliament, expressed their warmest wishes that it should be extended to their country; and declared their intention to bring in a bill for that purpose the following session. The design was approved by the general assembly of the church of Scotland; who rejected, by a majority of no less than two, a remonstrance that had been proposed against it. In consequence of these flattering appearances, a petition was prepared for parliament on behalf of the Roman Catholics in Scotland. But these expectations were soon damped. A pamphlet was published against the doctrine and professors of the popish religion, which represented them as the common foes to mankind and the disturbers of all states; and this being circulated among all classes, raised a number of enemies to the intended petition.

The opposition was at first chiefly conducted by some persons at Edinburgh, who assumed the title of Committee for the Protestant Interest; and under that denomination carried on a correspondence with all those who coincided with their opinions, and who formed a very large proportion of the common people in Scot-

land. As the committee at Edinburgh, from its residence in the capital of the kingdom, was deemed to consist of persons of the first importance, it directed in a manner the motions of all the others.

The persons who made up this committee, however, acted from no mean or mercenary views; they aimed only at the preservation of the Protestant religion, and the liberties of their country; both which they conceived were in danger, from the indulgence of government to individuals of the Roman Catholic persuasion.

Actuated by these ideas, they exerted themselves with so much activity, that the principal gentlemen of the Catholic persuasion thought it requisite for their safety to convey an intimation to the British ministry, that they were desirous to drop the application they had proposed to make for an indulgence similar to that which had been granted to their fellow-subjects in England of the same communion.

They published also in the newspapers the representation they had made to ministry; hoping thereby to convince the public, that they were sincerely desirous to remove any cause of dissatisfaction on their own account, and to submit to any inconveniency sooner than occasion disturbance. But matters were now gone too far to be conciliated by any means.

On the 2d day of February 1779, the populace met according to appointment, in order to carry into execution the various projects they had in contemplation. They began by an attack upon a house inhabited by a Roman Catholic bishop, with others of his persuasion, and which contained a place of worship. They committed it to the flames. They destroyed in the same manner another house that had also a chapel; after which they proceeded to vent their resentment on several individuals of that persuasion by burning their effects.

The next objects of their vengeance were those who had patronized the Roman Catholics. They beset the houses of Dr Robertson and Mr Crosby; but, on hearing of the intentions of the rioters, the friends of both came to their assistance in such numbers, and so well prepared to repel the fury of the populace, that they did not dare to exercise the violence they had premeditated.

This disappointment, which was accompanied by further precautions against their malevolent designs, put an end to the attempts of the mob at Edinburgh. But the spirit of dissatisfaction at the indulgence intended to the Roman Catholics still remained in full force. Ministry was held out as harbouring a secret determination to undermine the Protestant religion, and to introduce popery; and loaded in consequence with the most outrageous invectives.

By degrees the same ungovernable spirit was communicated to part of the English nation. The cry against popery became daily more loud among the inferior classes; and that inveteracy which had subsided during so many years, began to revive in as powerful a degree, as if the nation were actually under the impending terrors of persecution. To this were added the secret fears of others; who still imagined it was not inconsistent with good policy to discourage a religion, from the professors of which so much danger had accrued to the constitution of this country in former times. These, tho' averse

Britain. averse to all acts of violence, thought it necessary to keep alive the antipathy to it, and by no means to show the least willingness to grant any further indulgence than it had hitherto experienced.

From this motive they were of opinion, that a suspension of the laws enacted against it, though tacit and unauthorised, was sufficient to remove all complaints of harshness and oppression on the part of the Roman Catholics; and they looked upon the penal statutes as a requisite bar to confine them within the bounds of submission, and fear of offending.

Thus a society was formed in London, which took the title of the Protestant Association, of which lord George Gordon, who had rendered himself conspicuous in Scotland by his opposition to the repeal, was elected president: and it now prepared to act in a decisive manner against the resolutions of the legislature.

On the 29th of May 1780, the associators held a meeting in order to settle in what manner they should present a petition to the house of commons against the repeal of the penal statutes. A long speech was made on this occasion by their president, who represented the Roman persuasion as gaining ground rapidly in this country; that the only method of stopping its progress, was to go up with a spirited remonstrance to their representatives, and to tell them in plain and resolute terms that they were determined to preserve their religious freedom with their lives, &c.

This harangue being received with the loudest applause, he moved, that the whole body of the association should meet on the 2d day of June in St George's Fields, at ten in the morning, to accompany him to the house of commons on the delivery of the petition. This being unanimously assented to, he informed them, that if he found himself attended by fewer than 20,000, he would not present the petition. He then directed they should form themselves into four divisions; the first, second, and third, to consist of those who belonged to the City, Westminster, and Southwark; the fourth of the Scotch residents in London. They were, by way of distinction, to wear blue cockades in their hats.

Three days previous to the presentation of the petition, he gave notice of it to the house, and acquainted it with the manner in which it was to be presented; but this was received with as much indifference and unconcern as all his former intimations.

On the 2d day of June, according to appointment, about 50 or 60,000 men assembled in St George's Fields. They drew up in four separate divisions, as had been agreed, and proceeded to the parliament house, with lord George Gordon at their head. An immense roll of parchment was carried before them, containing the names of those who had signed the petition.

On their way to the house, they behaved with great peaceableness and decency; but as soon as they were arrived, great disturbances took place. The rioters began by compelling all the members of both houses they met with, to put blue cockades in their hats, and call out, "No Popery." They forced some to take an oath that they would vote for the repeal of the popery act, as they styled it. They treated others with great indignity, posting themselves in all the avenues to both houses; the doors of which they twice endeavoured to break open.

VOL. III. Part II.

Their rage was chiefly directed against the members of the house of Lords; several of whom narrowly escaped with their lives.

During these disturbances, lord George Gordon moved for leave to bring up the petition. This was readily granted; but when he proposed it should be taken into immediate consideration, it was strenuously opposed by almost the whole house. Enraged at this opposition, he came out several times to the people during the debates, acquainting them how averse the house appeared to grant their petition, and naming particularly those who had spoken against it.

Several members of the house expostulated with him in the warmest terms on the manifest absurdity of his conduct; and one of his relations, colored Gordon, threatened to run him through the meat any of the rioters should force their entrance into the house. It was some hours before the house could carry on its deliberations with any regularity, which was not done till the members were relieved by the arrival of a party of the guards. Order being restored, the business of the petition was resumed; when lord George Gordon told them it had been signed by near 120,000 British Protestant subjects. He therefore insisted that the petition should be considered without delay. But notwithstanding the dangers with which they were menaced, and the proof which the mover of the petition had given that no means should be left unemployed to compel them to grant it, the commons continued immovable in their determination. Of 200 members, then present in the house, six only voted for it.

In the mean time the mob had dispersed itself into various parts of the metropolis, where they demolished two Romish chapels belonging to foreign ministers; and openly vented the most terrible menaces against all people of that persuasion.

On the 4th of June they assembled in great numbers in the eastern parts of London; and attacked the chapels and houses of the Roman Catholics in that quarter, stripping them of their contents, which they threw into the street, and committed to the flames.

They renewed their outrages on the following day, destroying several Romish chapels, and demolishing the house of Sir George Saville in resentment of his having brought into parliament the bill in favour of the Roman Catholics.

Next day both houses met as usual; but finding that no business could be done, they adjourned to the 19th.

During this day and the following, which were the 6th and 7th of June, the rioters were absolute masters of the metropolis and its environs.

Some of those who had been concerned in the demolition of the chapels belonging to foreign ministers, having been seized and sent to Newgate, the mob collected before that prison, and demanded their immediate release. On being refused, they proceeded to throw fire and all manner of combustibles into the keeper's house; which unhappily communicated the fire to the whole building; so that this immense pile was soon in flames. In this scene of confusion, the prisoners were all released. They amounted to about 3000, among whom several were under sentence of death. They set fire, in the same manner, to the Bishop's Head and Fleet prisons, and to a number of houses belonging to Roman Catholics,

tholics. The terror occasioned by these incendiaries was such, that most people hung out of their windows pieces of blue silk, which was the colour assumed by the rioters; and chalked on their doors and shutters the words, "No Popery," by way of signifying they were friendly to their cause.

The night of the 7th of June concluded these horrors. No less than 36 different conflagrations were counted at the same time. The bank had been threatened, and was twice assailed; but happily was too well guarded for their attempts. In the evening, large bodies of troops arrived from all parts, and came in time to put a stop to the progress of the rioters. They fell upon them every where, and multitudes were slain and wounded, besides the numbers that perished thro' intoxication. It was not until the afternoon of the 8th, that people began to recover from their consternation. During great part of the day, the disorders of the preceding night had created so terrible an alarm, that the shops were almost universally shut up over all London. The melancholy effects of misguided zeal were not, however, confined solely to London. The outrageous disposition of the populace was preparing to act the like horrid scenes in other parts of England. The mob rose in Hull, Bristol, and Bath; but through the timely interposition of the magistracy, these places were saved from their fury.

On the subsiding of this violent and unexpected commotion, it was thought proper to secure lord George Gordon. He was arrested, and committed close prisoner to the Tower, after having undergone a long examination before the principal lords of the council.

On the 19th of June, both houses met again according to adjournment. A speech was made on this occasion from the throne, acquainting them with the measures that had been taken in consequence of the disturbances, and assuring them of the utmost readiness to concur in whatever could contribute to the safety and maintenance of the laws and liberties of the people. The speech was highly approved; but the conduct of administration was severely censured, and charged with unpardonable neglect for not calling forth the civil power, and employing the military in due time to obviate the mischiefs that had been committed. Ministry excused itself, from the want of sufficient strength to answer all the demands of assistance that were made during the riots, and the absolute impossibility of suppressing them till the arrival of troops from the country. The various petitions were now taken into consideration that had been presented for the repeal of the act which had occasioned the riots; but the house continued in the same mind. Nevertheless it was thought proper to yield somewhat to the prejudices of the people, by passing a bill for preventing persons of the Popish persuasion from teaching or educating the children of Protestants; but this was afterwards thrown out by the lords.

Nothing could have happened more opportunely for the present ministry than the riots just now related; for such were the alarm and terror occasioned by them, that the ardour which had appeared for promoting popular meetings and associations, and for opposing the measures of government, was in a great degree suppressed. The county meetings were represented as

having a tendency like the Protestant Association, to bring on insurrections and rebellions. Many began to consider all popular meetings as extremely dangerous; and among the commercial and monied people, there was not an inconsiderable number, who were so panic-struck by the late riots, that all attention to the principles of the constitution was over-ruled by their extreme anxiety about the preservation of their property. Had it not been for these events, though the minister was again at the head of a majority in parliament, it is probable that the spirit of opposition which prevailed in the different counties would have compelled administration to make some concessions to the people. But these transactions extremely strengthened the hands of administration, and rendered the exertions of the popular leaders less formidable. The popular party were also somewhat weakened, by the dissensions which took place among them in the county meetings, and assemblies of that kind, relative to annual parliaments and other political regulations which were proposed to be adopted.

In the suppression of these riots, however, the interference of the military without the command of the civil magistrate became a matter of suspicion to the people at large. In the house of lords the duke of Richmond expressed an expectation that some of his majesty's ministers would rise, and give their lordships assurances, that the measures taken in order to suppress the riots, which were defensible only upon the ground of necessity, would be so stated; and that what was illegally done, on the ground of necessity, would be cured by an act of indemnity.

Various other observations were thrown out relative to the king's prerogative and military law: upon which lord Mansfield observed, that neither the king's prerogative nor military law had any thing to do with the conduct of government in their endeavours to quell the late outrages. All men, of all ranks, descriptions, and denominations, were bound, by their oath of allegiance, to interpose for the prevention of acts of high treason, or felony, wherever any attempts to perpetrate such crimes were made in their presence; and were criminal, if they did not do it. In the whole of these proceedings, therefore, the military had not acted in their technical capacity as military, but had merely exercised their duty as civil men, which they, in common with other civil men, had both a right and an obligation to exercise. When a body of men were convened, without proceeding to the actual perpetration of treasonable or felonious acts, then, by a clause in the riot-act, the presence of the civil magistrate was necessary, before the military could interpose at all; and for this reason, that as no acts of felony were committed, they could have no plea in the civil character for meddling at all. But by the statute-law of the country, it became felonious in any combination of men to persevere in that combination, after the riot-act had been read by a justice of the peace; and this being done, then, and not till then, they had a constitutional reason for their interposition; namely, the privilege and duty of hindering the commission of felony, whenever they had it in their power. This being, therefore, the plain voice of the law, his lordship did not see how any prerogative of the king had been exercised, nor how military law had been established.

Britain.

other was likewise driven on shore, but afterwards recovered. Four ships of the line escaped, and the two frigates: but two of the former were much damaged in the action; in the course of which one Spanish ship, the *San Domingo*, of 70 guns and 600 men, was blown up. The five men of war taken were remarkably fine ships; and were afterwards completely refitted, manned, and put into the English line of battle. The Spanish admiral and his officers applied to Sir George Rodney to obtain the liberty of returning to Spain upon their parole of honour: but this he declined for some time, because he was informed that a great number of British seamen were then prisoners in Spain, who ought to have been released. However, afterwards receiving assurances that these should be immediately set at liberty, he released the Spanish admiral and officers upon their parole; and the prisoners in general were treated with such generosity and humanity, as appeared to make a great impression upon the court of Madrid and the Spanish nation. When admiral Rodney had supplied the garrison of Gibraltar with provisions, ammunition, and money, he proceeded on his voyage to the West Indies; having sent home part of his fleet, with his Spanish prizes, under the command of rear-admiral Digby; who took a French man of war on his return, the *Prothée*, of 64 guns and 700 men.

On the 20th of March there was an action in the West Indies, between some French and English men of war, the former under the command of *Mons. de la Mothe Picquet*, and the latter, being part of Sir Peter Parker's squadron, under that of commodore Cornwallis. The engagement was maintained on both sides with great spirit; but the French at length gave up the contest, and made the best of their way for Cape Frangois.

Admiral Rodney having arrived in the West Indies, and taken upon him the command of his majesty's ships at the Leeward islands, an action happened between him and the French fleet under the command of *count de Guichen*, on the 17th of April. The British squadron consisted of 20 ships of the line, besides frigates; and the French fleet of 23 ships of the line, and several frigates. The action began a little before one, and continued till about a quarter after four in the afternoon. Admiral Rodney was on board the *Sandwich*, a 90 gun ship, which beat three of the French ships out of their line of battle, and entirely broke it. But such was at length the crippled condition of the *Sandwich*, and of several other ships, that it was impossible to pursue the French that night without the greatest disadvantage. The victory was, indeed, claimed on both sides; but no ship was taken on either: and the French retired to Guadaloupe. Admiral Rodney's ship, the *Sandwich*, had suffered so much, that for 24 hours she was with difficulty kept above water. Of the British there were killed in this engagement 120, and 353 were wounded.

On the 15th of May, another action happened between the same commanders. It did not commence till near seven in the evening, only a few ships having engaged, which were soon separated; and the whole ended in nothing decisive. Of the British 21 were killed, and 100 wounded. The fleets met again on the 19th of the same month, when another action en-

ued; but this also terminated without any material advantage on either side. In the last engagement 47 of the British were killed and 193 wounded. According to the French accounts, the total of their loss, in these three actions, amounted to 158 killed, and 820 wounded.

It was a very unfavourable circumstance for Great Britain, that the French should have so formidable a fleet in the West Indies: and this great force of the enemy was augmented in June, by being joined with a Spanish squadron near the island of *Dominica*. The French and Spanish fleets, when united, amounted to 36 sail of the line. They did not, however, attack any of the British islands, or even reconnoitre the fleet under the command of Sir George Brydges Rodney, which then lay at anchor in *Gros Islet bay*. Such, indeed, were the vigilance and good conduct of that admiral, and so sensible were the inhabitants of these islands of his services, that the houses of assembly of *St Christopher's* and *Nevis* presented addresses to him, testifying their gratitude for the security they enjoyed in consequence of his spirited and seasonable exertions.

In the month of June, admiral Geary, who commanded the grand fleet, took twelve valuable merchant ships bound from *Port au Prince* to *Bourdeaux* and other ports of France: But in the month of July a very important and unexpected capture was made by the Spaniards, which could not but excite much alarm in Great Britain. On the 8th of August, captain *Moutray*, who had under his command the *Ramilies* of 74 guns and two frigates, with the trade bound for the East and West Indies under convoy, had the misfortune to fall in with the combined fleets of France and Spain, which had sailed from *Cadiz* the preceding day. The *Ramilies* and the two frigates escaped: but the rest were so completely surrounded, that five East Indiamen were taken, and 50 merchant ships bound for the West Indies. Their cargoes were extremely valuable: it was one of the most complete naval captures ever made; and was a heavy stroke to the commerce of Great Britain. The Spaniards on this occasion behaved to their prisoners with great attention and humanity; and appeared disposed to make an adequate return for the generous treatment which their countrymen had experienced from admiral Rodney. This loss, however, great as it was, was scarce sufficient to compensate the capture of *Fort Omoa* from the Spaniards, where upwards of three millions of dollars were gained by the victors, and, among other valuable commodities, 25 quintals of quicksilver, without which the Spaniards could not extract the precious metals from their ores; the loss of which consequently rendered their mines useless.

But while the British were making the most vigorous efforts, and even in the main getting the better of the powers who opposed them fairly in the field, enemies were raised up throughout all Europe, who, by reason of their acting indirectly, could neither be opposed nor resisted. The power which most openly manifested its hostile intentions was *Holland*; but besides this, a most formidable confederacy, under the title of the *armed neutrality*, was formed, evidently with a design to crush the power of Great Britain. Of this confederacy the empress of *Russia* declared herself the head; and her plan was intimated on the

Britain.

647
Account of
the armed
neutrality.

tain. 26th of February 1780, in a declaration addressed to the courts of London, Versailles, and Madrid. In this piece it was observed, that though from the conduct of her Imperial majesty it might have been hoped that her subjects would have been allowed peaceably to enjoy the fruits of their industry, and of the advantages belonging to all neutral nations, experience had proved the contrary: her imperial majesty's subjects had been often molested in their navigation, and retarded in their operations, by the ships and privateers of the belligerent powers. Her Imperial majesty therefore declared, that she found herself under the necessity of removing those vexations which were offered to the commerce of Russia, as well as to the liberty of commerce in general, by all the means compatible with her dignity and the welfare of her subjects: but before she came to any serious measures, and in order to prevent all new misunderstandings, she thought it just and equitable to expose to the eyes of all Europe the principles which she had adopted for her conduct, and which were contained in the following propositions:

1. That neutral ships should enjoy a free navigation, even from port to port, and on the coasts of the belligerent powers.

2. That all effects belonging to the subjects of the belligerent powers should be looked upon as free on board such neutral ships, excepting only such goods as were stipulated contraband.

3. Her imperial majesty, for the proper understanding of this, refers to the articles 10. and 11. of her treaty of commerce with Great Britain, extending her obligations to all the other belligerent powers.

In the treaty made between Great Britain and Russia in 1734 it is said, "The subjects of either party may freely pass, repass, and trade in all countries which now are or hereafter shall be at enmity with the other of the said parties, places actually blocked up or besieged only excepted, provided they do not carry any warlike stores or ammunition to the enemy: as for all other effects, their ships, passengers, and goods, shall be free and unmolested. Cannons, mortars, or other warlike utensils, in any quantity beyond what may be necessary for the ship's provision, and may properly appertain to and be judged necessary for every man of the ship's crew, or for each passenger, shall be deemed ammunition of war; and if any such be found, they may seize and confiscate the same according to law: but neither the vessels, passengers, or the rest of the goods, shall be detained for that reason, or hindered from pursuing their voyage." The same enumeration of the goods, stipulated as contraband, was given in the treaty concluded between Great Britain and Russia in 1766.

4. That in order to determine what characterizes a port blocked up, that denomination should not be granted but to such places before which there were actually a number of enemy's ships stationed near enough so as to make its entry dangerous.

5. That these principles should serve as rules in the judicial proceedings and sentences upon the legality of prizes.

Her imperial majesty declared, that she was firmly resolved to maintain these principles; and that, in order to protect the honour of her flag and the security of the commerce and navigation of her subjects, she

had given an order to that effect. The part of her naval forces. She added, that this measure would have no influence on the strict and rigorous neutrality which the states refused to observe, to her subjects, and not be provoked and forced to depart from her principles of moderation and impartiality. It was only in that extremity that her fleet would be ordered to act wherever her Honour, interests, and necessity should require. This declaration was afterwards communi- cated to the States-general by prince Gallitzin, envoy extraordinary from the empress of Russia, and she invited them to make a common cause with her Majesty, in order to assist her to protect her commerce and navigation. Similar commercial regulations and conventions were also made to the courts of Copenhagen, of Stockholm, and of Lisbon, in order, it was said, that, by the united care of all the neutral maritime powers, the navigation of all the neutral trading nations might be established and legalized, and a system adopted founded upon justice, and which, by its real advantages, might serve for rules as future ages.

The memorial of the empress of Russia, though very unfavourable to the views of Great Britain, received a civil answer from that court: but by other powers it was received, as it might naturally be expected, with much more cordiality. In the answer of the king of France it was said, that "what her imperial majesty claimed from the belligerent powers was nothing else than the rules prescribed to the French navy; the execution whereof was maintained with an exactness known and applauded by all Europe." He expressed his approbation of the principles and views of her Imperial majesty; and declared, that from the advantages she had now adopted, "solid advantages would undoubtedly result, not only to her subjects, but also to all nations." The kings of Sweden and Denmark also formally acceded to the armed neutrality proposed by the empress of Russia, and declared their perfect approbation of her sentiments. The States-general did the same: but on account of that disorder of deliberation which prevails in the councils of the republic, it was not till towards the close of the year that their concurrence was noticed to the court of Russia. It was resolved by the powers engaged in this armed neutrality to make a common cause of it at sea against any of the belligerent powers who should violate, with respect to neutral nations, the principles which had been laid down in the memorial of the empress of Russia.

But though the British majesty could not openly engage in war with all the other powers of Europe, they determined to take severe vengeance on the Dutch, whose ingratitude and perfidy now became a general subject of speculation. It has already been observed, that, ever since the commencement of hostilities with the Americans, the Dutch had shown much partiality towards them. This continued to be the case, even beyond what the natural avidity of a mercantile people could be supposed to produce: frequent remonstrances and remonstrances of course produced between the two nations, and the breach gradually grew wider and wider, until at last matter came to an extremity, by a discovery that the town of Amster- dam was about to enter into a commercial treaty with America. This happened in the beginning of 1781.

September 1780, by the capture of Mr Laurens, lately president of the American congress, and who had been empowered by that body to conclude a treaty with Holland. Mr Laurens himself was instantly committed prisoner to the tower of London, and a spirited remonstrance was made to the states of Holland, requiring a formal disavowal of the transaction. To this, however, no other answer could be obtained, than that they would take the matter into consideration according to the forms and usages of the country; and that a reply would be given as soon as the nature of their government would admit.

Such an equivocal answer could not by any means be satisfactory; and therefore the most vigorous measures were resolved on. On the 25th of January 1781, it was announced to the house, that his majesty had been obliged to direct letters of marque and reprisal to be issued against the States-general and their subjects. For the causes and motives of his conduct in this respect, he referred to a public manifesto against that republic, which he had ordered to be laid before the house. The charges against the republic, however, were briefly summed up by lord North in his speech on the occasion. The states, he said, in open violation of treaties, had not only refused to give Great Britain that assistance which those treaties intitled her to claim when attacked by the house of Bourbon, but had also, in direct violation of the law of nations, contributed as far as they could to furnish France with warlike stores, and had also at length thought proper to countenance the magistracy of Amsterdam in the insult which they had offered to this country, by entering into a treaty with the rebellious colonies of Great Britain, as free and independent states. By the treaty of 1678, it was stipulated, that, in case Great Britain was attacked by the house of Bourbon, she had a right to take her choice of either calling upon the States-general to become parties in the war, and to attack the house of Bourbon within two months, or of requiring an aid of 6000 troops, and 20 ships of war, which the States were to furnish immediately after the claim was made. But though this country had always preserved her faith with Holland, yet that republic had refused to fulfil the terms of this treaty.

His lordship farther observed, that the States-general had suffered Paul Jones, a Scotchman, and a pirate, acting without legal authority from any acknowledged government, to bring British ships into their ports, and

to rest there (A). A rebel privateer had also been saluted at the Dutch island of St Eustatius, after she had been suffered to capture two British ships within cannon-shot of their forts and castles. A memorial was presented at the Hague, in June 1779, on the breaking out of the war with Spain, to claim the aid we were intitled to require by the treaty of 1678; but of this not the least notice was taken on the part of the States. Two other notices had since been delivered, each of which met with the same reception. The British ministry had done all in their power to bring the States to a true sense of their interest; and when the necessity of the case compelled them to seize on Dutch ships carrying stores to France, they had paid the full value for the cargoes, and returned the ships; so that neither the private merchant, the private adventurer, nor the States, had suffered. France only had felt the inconvenience, by her being deprived of that assistance which she would have received from those cargoes.

With respect to an objection that had been made, that the treaty laid before the house, between the Dutch and the Americans, was nothing more than a contemplative project, his lordship remarked, that it was actually signed and sealed; the names of Van Berkel the pensionary of Amsterdam, and Mons. de Neuville, a merchant and burgher of that city, being subscribed to it on the part of the magistracy of Amsterdam, and the name of John Lee, as commissioner or agent for the congress of America. The States-general had also refused to pay the least attention to the requisition in his majesty's memorial, delivered by Sir Joseph Yorke, that proper notice should be taken of Van Berkel and his associates; so far as such a refusal could be implied by a contemptuous silence. As to the principal magistrates of Amsterdam, they were so far from disavowing the fact, or attempting to palliate it, that they gloried in the whole transaction; and expressly declared, even to the States-general, that what they had done was what their indispensable duty required.

His lordship added, that he lamented the necessity of a war with Holland; but it appeared to him to be an unavoidable measure. He confessed the situation of this country to be truly alarming; but when he considered the powerful stand that had already been made against the most alarming confederacy that had ever been formed against Great Britain, the little success that the enemies of this country had met with in all their

(A) This man, who had been formerly a servant in lord Selkirk's house, had landed in 1778 and plundered it of the plate, but without doing any farther mischief. The action, however, was very disagreeable to his own party; and, at the desire of D. Franklin, the plate was afterwards restored. After this exploit, he attempted to set fire to the town of Whitehaven, but without success. In 1779, he made a descent on the coast of Ireland, but without committing any act of hostility. His people indeed carried off some sheep and oxen, but their captain paid liberally for what they had taken. In the month of September 1779 he appeared in the Frith of Forth with several prizes. They advanced up the Frith above the island of Inchkeith, so as to be nearly opposite to Leith. His design was supposed to have been to burn the shipping there; but he was prevented from attempting this by a strong west wind; and such measures were also taken for the defence of the harbour, by erecting batteries and otherwise, that he would probably have miscarried had any attempt been made. On leaving the coast of Scotland he fell in with the *Setapis* and *Scarborough*, both of which he took after a most desperate engagement; by which all the vessels were reduced almost to wrecks. These were carried into a Dutch harbour; and it was this transaction to which lord North now alluded. He was called a *privateer*, on account of his not being at that time properly furnished with a commission either from France or America, though this was denied by the opposite party.

tain. their various attempts against it, and the spirit and resources of the nation, the public prospects appeared to him much less gloomy than some gentlemen thought proper to represent them. Our difficulties were certainly great; but he trusted that they were by no means insuperable. He was neither desirous of concealing their magnitude, nor afraid to meet them, great as they must be acknowledged; because he was convinced, that when the force of this country was fully exerted, it was equal to the contest; and that the only means of obtaining an honourable and a just peace, was to show ourselves capable of carrying on the war with spirit and with vigour.

Before this national resolution, however, could possibly have been communicated officially to the naval commanders in the West Indies, the Dutch were actually attacked. The defenceless island of St Eustatius was, on the 3d of February 1781, summoned by admiral Rodney and general Vaughan to surrender to the arms of Great Britain, and only one hour given to consider of it. The immense property on the island was confiscated, and a sale instituted, with such circumstances of apparent rapacity, as not only became the subject of a discussion in parliament, but drew upon this nation, whether justly or not we pretend not to determine, the ill will of all Europe.

The Dutch nation seem not in the present case to have behaved with any degree of prudence. Notwithstanding their provoking conduct towards Britain, they had made no preparations for war in case of being attacked. Notwithstanding this inactivity, however, it still appeared that they retained their ancient valour, and were in fact the most formidable naval enemies Britain had to contend with. By the month of August 1781 they had equipped a considerable squadron, the command of which was given to rear-admiral Zoutman. On the 5th of that month, this squadron fell in with the British fleet commanded by admiral Hyde Parker. The force commanded by the Dutch admiral consisted, according to their own account, of one of 74, one of 68, one of 64, three of 54, and one of 44, besides frigates; but the English account represents the Dutch fleet as consisting of eight two-decked ships. No gun was fired on either side till they were within the distance of half musket-shot. The action began about eight in the morning, and continued with an unceasing fire for three hours and forty minutes. Both sides fought with equal ardour, and little advantage was gained on either. When the heat of the action was over, both squadrons lay to a considerable time near each other, when the Dutch ships of war with their convoy bore away for the Texel; and the English ships were all too much disabled to follow them. A Dutch 74 gun ship sunk soon after the action. On board the British fleet 104 were killed and 239 wounded; and the loss of the Dutch was probably greater. Admiral Zoutman, in the account of the engagement transmitted by him to the Stadtholder, said, that his men "fought like lions;" and it was said by the British admiral, in the account sent by him to the admiralty, that "his majesty's officers and men behaved with great bravery, nor did the enemy show less gallantry." The admiral of the Dutch fleet was promoted, honorary rewards were given to the principal officers, and two months pay to the men, for their be-

haviour in this action. When admiral Parker's fleet arrived at the *Nore*, his majesty, in order to testify his sense of his merit, went on board his ship, with the avowed design, as it is said, of contesting on him the honour of knighthood: but this the admiral thought proper to decline; and it was generally supposed, that this veteran officer was much distressed, that more ships had not been sent to him, for which he had applied, and which he conceived might have been spared, and whereby he might have been enabled to obtain a complete victory.

Thus the war was still carried on in various parts of the globe in such a manner as seemed to evince the impossibility of eroding the power of Great Britain by any force whatever. In Europe the utmost efforts of France and Spain were able to produce nothing more than the annual parade of a mighty fleet in the channel. This was answered by the appearance of a British fleet so formidable that the allies never dared attack them. The states of Holland had drawn out their force; and this too was opposed by one, which, if insufficient to conquer, was at least able to prevent their effecting any thing detrimental to our possessions. In the East Indies the united powers of the French and Indians had been conquered, and the Dutch settlements had suffered severely. In the year 1781, however, the British naval power in the West Indies seemed to sink, and some events took place which threatened a total ruin of the empire in these parts. This was owing to the vast superiority of the combined fleets of France and Spain, by whom that of Britain was now so far outnumbered, that they could not achieve any thing of consequence. An ineffectual attempt on the island of St Vincents was made by admiral Rodney, and an indecisive engagement took place, April 28th 1781, between admiral Hued and the count de Grasse; the event of which, however, if not advantageous, was certainly honourable to Britain, as the French had a superiority of six ships of the line. The damage done to the British ships having obliged them to retire to Barbadoes to rest, the French took that opportunity to make a descent on the island of Tobago. The governor, Mr Ferguson, made a gallant resistance; but was at last obliged to surrender, as no prospect of succours appeared. On his return to England he complained loudly that the island had been unnecessarily lost. Admiral Rodney had sent rear-admiral Drake with six sail of the line, three frigates, and some troops, to the assistance of the island; but they were sent too late, and the island had capitulated before any relief was afforded it. In a letter of admiral Rodney, which was published in the gazette, some turpitude was related, that the place had surrendered too soon: upon which governor Ferguson published an account of the siege, signed with his name, in all the London papers, in which he recriminated on the admiral. The governor's narrative was so peevish, so apparently satisfactory, and his charge against the admiral so strong, that it was thought incumbent on the latter to vindicate his conduct: but no answer to the governor's accusation ever appeared.

Besides the inconveniences which the British West India islands suffered in consequence of the war, it was also a misfortune to some of them that they were involved in a domestic dispute, occasioned by the

Britain.

tion at the conduct of their governors. This was particularly the case with Jamaica and Barbadoes, in both which islands there were frequent contels about this time between the houses of assembly and the governors. But the remonstrances of the inhabitants on this subject did not meet with much attention from those who had it in their power to afford them relief: for it seemed, indeed, to be a kind of maxim with the British administration at this period, to pay little regard to any complaints from the subjects of the empire, respecting any abuse of authority, from whatever quarter they might come, Ireland only excepted; and, with respect to that kingdom, they were induced to relax a little from the high tone they were accustomed to assume, by the powerful and energetic arguments of the Irish volunteers. See IRELAND.

The great and decisive stroke, however, which happened this year, was the capture of lord Cornwallis with the division of the army under his command. Other events, indeed, were sufficiently mortifying. The province of West Florida had been reduced by the Spaniards; Minorca was besieged by them with an apparent impossibility of holding out; the island of St Eustatius was surpris'd by the French; and in short every circumstance seemed to proclaim the necessity of putting an end to a war so calamitous and destructive.

All the disasters that had yet happened, however, were not sufficient to induce the ministry to abandon their favourite scheme of war with the colonies. The parliament met on the 27th of November 1781. It has already been observed, that in the year 1780 the ministry had received such a signal defeat as seemed to prognosticate the ruin of their power. They had indeed afterwards acquired a majority, and the extreme terror produced by the riots had contributed not a little to the establishment of their authority. The remembrance of what had passed, however, most probably induced them to a dissolution of parliament: while the successes at Charlestown and other parts of America, once more gave them a decided majority in both houses. But the disasters of the year 1781 involved them in the utmost difficulty and distress. In the speech from the throne, his majesty observed, that the war was still unhappily prolonged by that restless ambition which first excited the enemies of his crown and people to commence it, and which still continued to disappoint his earnest desire and diligent exertions to restore the public tranquillity. But he should not answer the trust committed to the sovereignty of a free people, nor make a suitable return to his subjects for their zealous and affectionate attachment to him, if he consented to sacrifice, either to his own desire of peace, or to their temporary ease and relief, those essential rights and permanent interests, upon the maintenance and preservation of which the future strength and security of Great Britain most depend. The events of war he said, had been very unfortunate to his arms in Virginia, having ended in the loss of his forces in that province. No endeavours, he added, had been wanting on his part to extinguish that spirit of rebellion which his enemies had found means to foment and maintain in the colonies, and to restore to his deluded subjects in America that happy and prosperous condition which they had formerly derived from a due obedience to the laws; but the late misfortune in that quarter called

loudly for the firm concurrence and assistance of parliament, in order to frustrate the designs of their enemies, which were equally prejudicial to the real interests of America, and to those of Great Britain. At the close of the speech, his majesty observed, that among the many ill consequences which attended the continuation of the present war, he sincerely regretted the additional burdens which it must unavoidably bring upon his faithful subjects: but he still declared his perfect conviction of the justice of his cause; and that he had no doubt, but that, by the concurrence and support of his parliament, by the valour of his fleets and armies, and by a vigorous, animated, and united exertion of the faculties and resources of his people, he should be enabled to restore the blessing of a safe and honourable peace to all his dominions.

A motion for an address of thanks, couched in the usual style, was made in the house of commons. It was urged, that a durable and advantageous peace could result only from the firm, vigorous, and unremitting prosecution of the war. The present was not the time to relinquish hope, but to resolve upon exertion. By despair we should invite calamity to overwhelm us; and it would ill become a great and valiant people, whose resources were yet powerful and numerous, to submit where they should resist; to look with indifference upon their political importance; and to tarnish, by indolent pusillanimity, the national and dear-bought glories both of remote and recent æras, instead of opposing, with augmented force, a combination whose inveterate efforts to throw out of the scale of Europe the whole political existence of Great Britain, were strengthened by the late victory over lord Cornwallis in Virginia. But if a general spirit of unanimity, so requisite at one of the most alarming and important periods in the British annals, were to arise within the walls of parliament, and thence to diffuse itself throughout the body of the people, the gloom that hovered round us would rapidly disperse, and great successes would conduct the nation back to all its pristine splendor and felicity.

This was vehemently opposed by Mr Fox and Mr Burke. The latter remarked, that if there could be a greater misfortune than had already been undergone by this kingdom in the present disgraceful contest, it was hearing men rise up in the great assembly of the nation to vindicate such measures. If the ministry and the parliament were not to be taught by experience; if neither calamities could make them feel, nor the voice of God make them wise; what had this fallen and undone country to hope for? If any thing could tend to deject the people of England, to make them despair of their situation, and resign themselves to their fate, it must be to receive information that their ministers, after all that had been suffered, were yet determined to go on with the American war. A battle might be lost, an enterprize might miscarry, an island might be captured, an army might be lost in the bed of cauries, and even under a system of vigour and foresight; because the battle, after all the wisdom and bravery of man, was in the hands of heaven: and if either or all these calamities had happened in a good cause, and under the auspices of a vigilant administration, a brave people would not despair. But it was not so in the present case. Amidst all their sufferings and

696
King's
speech
Nov. 1781.

Britain. and their misfortunes, they saw nothing so distressing as the weakness or wickedness of their ministers. They seemed still determined to go on, without plan, and without foresight, in this war of calamities; for every thing that happened in it was a calamity. He considered them all alike, victories and defeats; towns taken, and towns evacuated; new generals appointed, and old generals recalled; they were all alike calamities in his eyes, for they all spurred us on to this fatal business. Victories gave us hopes, defeats made us desperate, and both infligated us to go on. They were, therefore, both calamities; and the king's speech was the greatest calamity of all; for the king's speech showed us the disposition of the ministers: and this disposition was not to retreat an inch; to go on, to plunge us deeper, to make our situation more disgraceful, and more unhappy.

In the course of the debate, it was contended on the part of administration, and particularly by lord North, that by the address, as originally proposed, the house did not pledge themselves to any continuance of the American war: but this was strongly denied by the gentlemen in opposition. However, the point was at last decided in favour of ministry by a majority of 216 to 129; and the address was then carried as originally proposed.

In the house of peers, a motion for an address similar to that of the house of commons, was made by lord Southampton, and seconded by lord Walsingham. It was vigorously opposed by the earl of Shelburne; who observed, that seven years had now elapsed since blood was first drawn in America; and from that period to the present the affairs of Great Britain had been continually growing worse. A long progress in the war had left us in a situation in which there were no advantages to console; but dangers and calamities had arisen, which were unknown to us at the commencement of hostilities. Of nearly 87,000 men sent to America, how few had returned! What treasures had been in vain expended! What enormous debts accumulated! The most liberal national supplies had been followed by nothing but calamities; and the whole proceedings of the ministry manifested a want of system and of intelligence. Among other instances of mismanagement, his lordship remarked, that, instead of blocking up the French fleets within their own harbours, or immediately intercepting them on their putting out to sea, we had suffered them to sail far upon their expeditions to our distant settlements; and when they had acquired this great advantage, we slowly followed their powerful armaments with inconsiderable squadrons, and scarcely ever reached the place of destination till the enterprises of the enemy were totally accomplished. His lordship also declared it to be his opinion, that the capture of earl Cornwallis was owing to the preceding capture of St Eustatius. As to the farther prosecution of the war with the least prospect of success, it was totally impossible: the nation was too much exhausted both of men and money; recruits were not to be procured for the army; and as to our navy, if we had the best first lord of the admiralty, and the ablest board that ever sat, it was impossible to provide for all the distant services of so extensive a war. The reason was obvious. The fine navy that belonged to Great Britain at the

conclusion of the last war had been suffered to rot and moulder away; while France and Spain had recruited and repaired their marine during the whole period of the peace.

Among other strictures on ministerial conduct, it was observed by the duke of Richmond, that at present scarcely a seventh part of the people were represented, while all the remainder had no concern whatever, either virtually or individually, in the management of their own affairs; which, their lordships well knew, the constitution of this country, as originally framed, gave them a right to have. He appealed to the house, whether many of their lordships did not name the members for several boroughs, and whether the representatives were not chosen only by the management of two or three burghesies. Were this point returned, his grace declared, that he should still expect to see the country capable of regaining some portion of its former greatness. He also made some observations on the interior cabinet, which had, he said, been the ruin of this country. To prove its mischievous tendency, he instanced the declaration of the late earl of Chatham, who confessed to the house, that "he was duped and deceived, and that he had not been ten days in the cabinet before he felt the ground rotten under his feet." His grace likewise said, that though it was the middle of a war, he made no scruple to recommend it most strenuously to government, immediately to set about curtailing the numbers of the army, and that as much as possible. He recommended, that arms should be put into the hands of the people, for the purposes of domestic defence; and he did not doubt but that in this case, they would act with greater power and success, than even the most numerous military force. He also advised withdrawing the troops from America, augmenting the navy as much as possible, and sending such succours to the West India islands as might enable them effectually to resist any attempts from the enemy.

Lord Stormont defended the address as originally proposed; and observed, that the language of the speech from the throne was proper to be held by any prince worthy of the crown, in a moment like the present; and the long established custom rendered such an address as had been moved the fit answer to it. The preservation of America, as a dependent part of the British empire, was too important to be relinquished; and the present crisis, so far from justifying despair, called for a redoubled ardour, and for immediate exertion.

The lord-chancellor said, that the present speech from the throne, like all others at the commencement of a session, was no more than a brief state of the nation, delivered in the ancient style of composition, and conformably to established usage, from almost the first existence of a parliament; and as to the address, its language not being specifically binding, their lordships might vote in favour of it, without pledging themselves to support any future ministerial measure whatever. The house at length divided, when lord Shelburne's amendment was rejected by a majority of 75 to 31. A short protest against the address, was entered by the duke of Richmond, the marquis of Rockingham, and earl Fitzwilliam; in which they declared, that they dissented, "for reasons too often urged in vain for the last seven years against the ruinous prosecution

Britain.

Britain.

ention of the unjust war carrying on by his majesty's ministers against the people of North America, and too fatally confirmed by repeated experience, and the late disgraceful loss of a second army, to stand in need of repetition."

Though ministers thus succeeded in carrying the addresses in the usual form, they did not meet with the like success in their main plan of carrying on the war. After the debate on the number of seamen, which was fixed at 100,000 for the ensuing year, Sir James Lowther moved as a resolution of the house, "That the war carried on with America had been ineffectual for the purposes for which it was undertaken; and that all farther attempts to reduce that continent by force of arms would be in vain, and must be injurious to this country by weakening her powers to resist her ancient and confederated enemies." This was supported by a number of arguments interlarded with the most severe reflections on ministerial conduct. In the course of this debate it was observed, and indeed with evident truth, that every state of consequence in Europe withheld its succours, and left us to contend alone against a multitude of enemies; so that we should search in vain for an ally from one corner of the universe to the other. As to the American war, in which the ministry so madly persisted, it was not like a war between two rival, or two neighbouring states, about a barrier or a boundary; a contest which, however it ended, could not detract much from the importance or weight of either. It was a war in which the conclusion of every campaign was against us; in which we weakened no enemy by our efforts; in which we had suffered every thing without gaining any thing. The American war had been a war of delusion from the beginning to the end. Every promise had been broken, every assertion had been falsified, every object had been completely given up. The ministry had said one thing one day; and the next day they had come down again, and with grave faces said what was directly contrary. But it was time to put an end to these delusions; not the least prospect of success in the war now remained; the period was therefore come, when it was indispensably necessary that the parliament should interfere, in order to avert that ruin with which this unhappy country was so immediately threatened.

658
Different
plan of war
proposed
by Lord
North.

The motion was opposed by lord North; who said, that if it was agreed to by the house, it must put an end to the American war in every shape, and even cripple the hands of government in other respects. It would point out to the enemies of this country what were to be the mode and operations of the war; and thus inform the enemy in what manner they might best point their operations against this country during the next campaign. Great Britain must not retain any post in the colonies; for that would be considered as one mode of attempting to reduce the Americans to obedience by force. But was it not manifest, that there might be a necessity of retaining certain posts in America, for the convenience even of carrying on the war against France and Spain?

With respect to the American war in general, his lordship acknowledged, that it had been extremely unfortunate; but he affirmed, that the misfortunes and calamities which had attended it, though of a most furious and fatal nature, were matters rather to be de-

plored and lamented as the events of war, in themselves perpetually uncertain, than to be ascribed to any criminality in ministers. He had always considered the American war as a war of the most cruel necessity; but at the same time as a war commenced for the support of the just rights of the crown and of the parliament of Great Britain. He would also venture to declare, that as the war was unfortunate to all his fellow-subjects, so it was particularly distressing to himself. He had always considered it as the heaviest calamity of his life; and if, at any time, a sacrifice, not only of the emoluments of his situation, but even of the whole of his private fortune, could have purchased for his country a safe and honourable peace, he would have made that sacrifice with the utmost cheerfulness, and thought the opportunity of offering it the greatest blessing which could possibly have befallen him. His lordship added, that though he totally disapproved of the motion, yet he was willing to declare it to be his opinion, that it would not be wise nor right to go on with the American war as we had hitherto done; that is, to send armies to traverse from the south to the north of the provinces in their interior parts, as had been done in a late case, and which had failed of producing the intended and the desired effect.

This new method of carrying on the war was as much disapproved of as the other; nor indeed did it seem to be generally believed that any material alteration was to take place in the ministerial system. General Burgoyne observed, that declaring a design of maintaining posts in America, of the nature of New York, was declaring a design of offensive war; and that such a maintenance of posts would prove an improvident and a preposterous war. The great if not the only purpose of keeping places of arms upon an enemy's coast, and especially upon a continent, must be for offensive war. During the glorious administration of the earl of Chatham, a place of arms was intended to be established at St Malo's; and it was afterwards established at Belleisle upon a more extensive view than that of a mere inlet into the country. It made a powerful diversion, and drew a great military force from Germany, to protect the whole range of coast from Bayonne to Dunkirk, which was threatened by an embarkation from that place of arms. But the circumstance which rendered that menace against the French coast either practicable or formidable was, our dominion of the sea. At that resplendent æra, our naval flag rode in the very bays of France as securely as if anchored at Spithead; and a few frigates would have convoyed an army of 20,000 men to any one point of the French or Spanish coast. This then could be produced as a just precedent for a place of arms. But what other precedents existed? The command of a strait, by which it was possible either to give an inlet for commerce, or to divide the ports of an enemy. Of such a nature was Calais, which, together with Dover, kept separate as often as we thought proper the great ocean and the German sea. Such also was Gibraltar; a place of arms that gave a virtual superiority to the navy of England, though with an inferior number of ships, as separating the ports of the house of Bourbon in the ocean from their ports in the Mediterranean, and preventing the junction of their fleets. But New York, as a place of arms, could au-

Britain. fwer no possible purpose but to feed an impracticable war, and to multiply that system of contracts, loans, and influence, which, after having operated to the loss of every dependence of the country, was ready to give the final blow to the last remains of property and liberty in the country itself.

660
He recants
his original
principles
concerning
America.

The general added, that he had not hitherto touched upon the principle of the American war. The impracticability of it was a sufficient justification for supporting the present motion. But he was now convinced that the principle of the American war was wrong, though he had not been of that opinion when he formerly engaged in the service in America. He had been brought to this conviction, by observing the uniform conduct and behaviour of the people of America. Passion, prejudice, and interest, might operate suddenly and partially; but when we saw one principle pervading the whole continent, the Americans resolutely encountering difficulty and death for a course of years, it must be a strong vanity and presumption in our own minds, which could only lead us to imagine that they were not in the right. It was reason, and the finger of God alone, that implanted the same sentiment in three millions of people. He would assert the truth of the fact against all which either art or contrivance could produce to the contrary. He was likewise now convinced, upon comparing the conduct of the ministry, as time had developed their system, that the American war formed only a part of a general design levelled against the constitution of this country and the general rights of mankind.

After some farther debate, Sir James Lowther's motion was rejected by a majority of 220 to 179. This, however, was a majority in which the ministry had little reason to exult; as it was sufficiently apparent, from the numbers who voted against administration, that the uninfluenced sense of that house was clearly and decisively against any farther prosecution of the American war.

661
Debate on
the army
estimate.

Other arguments to the same purpose with those of general Burgoyne, just mentioned, were used in the debate on the army estimates. On the 14th of December, the secretary at war informed the house, that the whole force of the army, including the militia of this kingdom, required for the service of the year 1782, would amount to 186,220 men, and for this force the parliament had to provide. The sum required for these troops for pay, cloathing, and other articles, amounted to four millions two hundred and twenty thousand pounds. This military force exceeded that of the last year by 4074 men; and the expence was consequently greater by 29,067 l. 15s. The increase was occasioned by the greater number of troops already sent, or then going, to the East Indies. But the expence of those troops was to be reimbursed by the East India company.

After some farther statements relative to the military force of the kingdom and its expence had been made by the secretary at war, colonel Barré rose, and with great vehemence declared, that the estimates of the army which were laid before that house were scandalous and evasive. There was a much greater number of non-effective men than were stated in the estimates. In fact, they amounted to a fifth part of the army. The house should also recollect, that the estimates lying on

the table did not compose the whole of the expences of the army; for extraordinaries of several millions were yet to come. Neither were the men under the several descriptions given by the secretary at war the whole number of military force employed. Other troops were employed solely at the discretion of the minister, and paid irregularly and unconstitutionally, without the assent or knowledge of the legislature; particularly the provincial corps in America, amounting to more than a thousand men in actual service, the statement of which force, though it had been called for from year to year, was never brought into the estimates.

British

With respect to the army estimates, the colonel proceeded to observe, that in many instances they were filled with such abandoned impositions, that there appeared an actual design to treat inquiries from the parliament with sovereign contempt. Several regiments, of which the number of men did not amount to one hundred, were set down at eight hundred; and others not having more than fifty were mentioned in the estimates as consisting of five, six, or seven hundred men. Indeed, too large a part of the armies, for which that house had been persuaded to give their votes, existed only upon paper. Amongst other regiments, the royal English fusiliers had not even a fourth of their complement. The royal Scotch fusiliers were in a worse predicament. Their number fell short of even one hundred men. The 60th regiment was stated as amounting to 3500 men, when the fact was, that it did not consist of 1500; and many others might be enumerated in the same situation. The statement of the estimates relative to garrisons, particularly those of Gibraltar and Minorca, were equally delusive and overcharged.

Lord George Germaine said, that the reason why the provincial corps had not been included in the estimates was, that some share of the public money might be spared, by avoiding to vote an establishment for these troops. They were raised and paid in a manner by much the most economical for the nation. They were solely under the management of the commander in chief; and an officer, called the *inspector-general of the provincial corps*, regularly took care to muster them from time to time; nor was a single man paid for, if not in actual employ. His lordship also informed the house, that the ministry were unanimously of opinion, that, considering the present situation of affairs, and the misfortunes of the war, it would not be right to continue any longer the plan on which it had hitherto been conducted; and therefore that a fresh army would not be sent to supply the place of that captured at York-town under earl Cornwallis.

Sir George Savile expressed the strongest disapprobation of any farther prosecution of the American war, or of raising any more troops for that purpose. He adverted to the intimation which had been given by the ministry, that a change was to be made in the mode of conducting the American war. Thus, he said, was in fact telling the house, that they were determined to prosecute the war with all the feeble efforts of which they were yet capable. Every unprejudiced and sensible observer must perceive, that so extraordinary a conduct resembled, if it did not indicate, the violence of insanity. General Conway declared, that he entirely disapproved of a continuance of the Amer-

Britain. rican war in any form, as he wished that it might totally cease. He eagerly desired the recal of our fleets and armies, and was anxious for an entire and immediate prevention of those calamities which had almost completed the destruction of the empire. He considered an avowal of the independence of America as a severe misfortune, and a debasing stroke against Great Britain; but of the two evils he would choose the least, and he would submit to the independence of America. In short, he would almost yield to any circumstance whatsoever, rather than persist a day longer in the prosecution of so pernicious a war. Ideas had been started relative to a war of posts, among which New York had been particularly mentioned. But on what military authority did the ministry presume to think that New York was tenible? What garrison would be able to maintain it? The diversity of military opinions given on this subject served rather to alarm than to convince. To secure New York, the possession of Long Island, which is a hundred miles in length, is absolutely necessary; and it was well known that Sir Henry Clinton, with all his troops, did not consider himself as secure. Notwithstanding these and other arguments, however, the question was carried in favour of ministry by a considerable majority, and the supplies were voted accordingly.

Besides the grand question for and against the continuance of the American war, several other matters of smaller moment were agitated this session; particularly the affair of St Eustatius* as already mentioned, an inquiry into the state of the navy, and into the causes of our bad success in the American war. All these questions were carried in favour of ministry, though not without a strength of opposition they had never experienced before. A motion for censuring lord Sandwich was lost only by 236 to 217; and so general did the desire of a change of administration now appear, that it excited no small degree of surprize that the present ministers should still retain their places. Nothing could set in a more striking point of view the detestation in which they were held, than the extreme aversion shown at admitting lord George Germaine to the dignity of peerage. On this occasion, the Minden business was not only ripped up, but after his actual investiture, and when he had taken his seat in the house, under the title of lord viscount Sackville, a second debate ensued relative to the dishonour the peers had sustained by his admission into their house. It was moved by the marquis of Caermarthen, that "it was reprehensible in any minister, and highly derogatory to the honour of that house, to advise the crown to exercise its indisputable right of creating a peer, in favour of a person labouring under the heavy censure of a court martial," which was particularly stated in the motion, and also the public orders given out on the occasion by the late king. The marquis urged, that the House of peers being a court of honour, it behoved them most carefully to preserve that honour uncontaminated, and to endeavour to mark out, as forcibly as possible, the disapprobation which they felt at receiving into their assembly, as a brother peer, a person stigmatized in the orderly books of every regiment in the service. The earl of Abingdon observed, that he could not help conceiving, that, although there was not a right of election, there was

and must be a right of exclusion vested in that house, when the admission of any peer happened to be against the sense of their lordships. His judgment of this arose not only from the idea, that that house was possessed of original rights, as independent of the crown as of the people; but from the circumstance of their being the hereditary counsellors of the crown, against the sense of whom, he held, the crown could not of right exert itself. His lordship declared, that he considered the admission of lord George Germaine to a peerage, to be no less an insufferable indignity to that house, than an outrageous insult to the people at large. It was an indignity to that house, because it was connecting them with one whom every soldier was forbidden to associate with. It was an insult to the people; for what had the person raised to the peerage done, to merit honours superior to his fellow-citizens? He had only one claim to any kind of promotion; and that was, that he had undone his country, by executing the plan of that accursed, invisible, though efficient cabinet, from whom, as he had received his orders, so he had obtained his reward.

Lord Sackville declared, that he neither knew by whose advice he had been raised to this dignity, nor thought, that, in a point of this nature, the recommendation of any minister was in the least needful. To bestow honours was the peculiar and universally admitted prerogative of the crown, provided that the parties advanced to them were competent to receive them. This he insisted was the case at present. The sentence of the court-martial was stated as the ground of the objection against his elevation to the peerage; but even such a sentence did not amount to any legal disability whatsoever. Twenty-three years had elapsed since the court-martial which sat upon him had pronounced that sentence; and he should naturally suppose, that such of their lordships, and of the public in general, as were at all acquainted with the peculiarly hard and unfair circumstances which accompanied his trial, had been long accustomed to behold this business in its proper point of view. Affailed by an excess of acrimony, at least equal to any that a British officer could have experienced from enemies at once implacable and unjust, he was condemned unheard, and punished previously to his trial. In these circumstances, it was well known, that he had challenged his accusers to come forward; that he provoked inquiry; and that he insisted upon a trial. He was assured at the time, that if the determination of the court-martial should even prove capital, it would be carried into execution: but no intimations of this kind could dissuade him from insisting that a trial should take place; and he flattered himself, that the candour and equity of their lordships would lead them to conclude, that such behaviour, under such circumstances, could only result from a consciousness of innocence. To the sentence of it he had submitted; and, as the result of such submission, he thought that he had then acquitted himself to his country and to the public. At the present moment, it was extremely singular, that although neither the charge, nor the defence, nor the evidence, nor in short any one part of the proceedings on the trial, was before their lordships, they were called upon to put the sentence a second time in force against him. He trusted, however, that their lordships would

662
Debate on admitting Lord George Germaine to sit in the House of Peers.

would call to mind the occurrences which had taken place, with respect to himself, subsequent to that period. In 1765, not more than four years after the trial, he was appointed to an office in administration. Previously to his acceptance of the propositions then made to him that he should bear a part in administration, it was agreed for him to become a member of the council-board. There he accordingly took his seat; and thenceforward considered such a circumstance as virtually a repeal of the sentence of the court-martial. A revision of the proceedings of the court-martial was now unattainable; for during the space of 23 years, the period of time which had elapsed since the trial, every member who had sat upon it, except one, had been dead and buried. An attempt to investigate the motives which actuated the several members of the court was equally impracticable. He hoped, therefore, their lordships would be of opinion, that he was fully competent to receive the title which his sovereign had been graciously pleased to bestow upon him; and that it was neither expedient, necessary, nor becoming for that house, to fly in the face of the crown, or to oppose its indisputable prerogative, because it had advanced an old and faithful servant to the dignity of a feat among their lordships.

The duke of Richmond observed, that, from the reign of Edward III. to the time of Henry VII. it was expressly stated, in every new patent of the creation of a peer, that such creation was made *with the consent of parliament*; nor did a single instance occur, during the whole of this period, of any title being granted without the particular acquiescence of the house of lords. After the reign of Henry VII. the crown carried with a considerably less restraining hand this exercise of the prerogative; and during the latter times, it had been generally regarded as an incontestable and established right. It appeared, however, that the ancient principles of the British constitution had set boundaries to restrain this exercise of the prerogative; and that formerly a legal disability was not the only circumstance which might amount to a disqualification for the peerage. Some insinuations had been thrown out, respecting the decision of the court-martial, which were far from being well grounded. When the court-martial took place, for the purpose of determining the criminality or the innocence of the noble viscount, the times were not, as had been represented, remarkable for the predominance of clamour or of faction. He observed, that their lordships were not ignorant, that the noble viscount rested a considerable part of the vindication of his behaviour at the battle of Minden, upon the supposed existence of a striking variation in the orders delivered from prince Ferdinand to the commander of the cavalry. It was understood that the first order was, that *the cavalry* should advance; and the second, that *the British cavalry* should advance. Yet, even under these supposed contradictory orders, it was evident that the noble lord should advance; and, certainly, the distance being short, he enjoyed a sufficient space of time for obedience to his instructions. Lord Southampton, who delivered one of the messages, was now present in the house; and it should seem, that he had no choice, on this occasion, but to acknowledge, either that he did not properly deliver such orders to the noble viscount, or that the latter, having properly received them,

neglected to obey them. But whatever difficulties might have arisen, during the endeavours to determine exactly how much time had actually been lost, in consequence of the non-compliance of the noble viscount with the orders which he received, his grace said, that he could with much facility have solved, what all the witnesses examined as to this point were not able positively to determine. If, as he was summoned to appear upon the trial, his deposition had been called for, he could have proved, because he held all the while his watch within his hand, and seldom ceased to look at it, that the time lost when the noble viscount delayed to advance, under pretence, that, receiving such contradictory orders, it was impossible for him to discover whether he ought to advance with the *sole* cavalry, or only with the British cavalry, was *one hour and a half*. It was, therefore, extremely evident, that the noble lord had it in his power to have brought up the cavalry from the distance of a mile and a quarter; in consequence of which, by joining in the battle, they might have rendered the victory more brilliant and decisive. But, before the arrival of this cavalry, the engagement was concluded. Such was the testimony, his grace said, which, having had the honour to serve, at the battle of Minden, under prince Ferdinand of Brunswick, he must have borne, if, being summoned, the members of the court-martial had thought proper to have examined him on the trial. Under such circumstances, the noble viscount could have little reason to complain of the sentence of the court-martial, of the orders which followed, or of the loss of his commission.

The motion was powerfully supported by other arguments, both by the duke of Richmond himself and other peers; but, however, was rejected by a majority of 93 against 28. A protest was entered, signed by nine peers, in which the sentence and the public orders were particularly stated; and in which they declared, that they "could not look upon the raising to the peerage a person so circumstanced, in any other light than as a measure fatal to the interests, as well as to the glory of the crown, and to the dignity of that house; insulting to the memory of the late sovereign, and likewise to every surviving branch of the illustrious house of Brunswick; repugnant to every principle of military discipline, and directly contrary to the maintenance of the honour of that house, and to that honour which has for ages been the glorious characteristic of the British nation, and which, as far as could depend on them, they found themselves called upon, not more by duty than inclination, to transmit pure and unshuffled to posterity."

The ruinous tendency of the American war was now so strikingly apparent, that it became necessary for those who had a just sense of the dangerous situation of their country, who wished well to its interests, or even to prevent its destruction, to exert the most vigorous efforts to put an end to so fatal a contest. Accordingly, on the 22d of February, a motion was made by general Conway, "That an humble address should be presented, earnestly imploring his majesty, that, taking into his royal consideration the many and great calamities which had attended the present unfortunate war, and the heavy burdens thereby brought on his loyal and affectionate people, he would be gra-

Britain.

viously pleaded to listen to the humble prayer and advice of his faithful commons, that the war on the continent of North America might no longer be pursued for the impracticable purpose of reducing that country to obedience by force; and expressing their hope that the earnest desire and diligent exertion to restore the public tranquillity, of which they had received his majesty's most gracious assurances, might, by a happy reconciliation with the revolted colonies, be forwarded and made effectual; to which great end, his majesty's faithful commons would be ready most cheerfully to give their utmost assistance." In the speech by which he introduced this motion, the general set forth the enormities with which the British arms had so frequently been stigmatized by opposition, and the excessive animosity of the Americans. Not a single friend to the British government (he said) could be discovered amongst the inhabitants of North America, from one end of the country to the other. We had, indeed, at present no object to contend for: for if it could be admitted for a moment, even for the sake of argument, that it were possible we might conquer at this late, what benefits would repay the struggle for the victory? We should then only gain a desert, a country depopulated by the war, which our despotism and barbarity, our avarice and ambition, our antipathy for freedom, and our passion for injustice, had kindled in her bosom. But all expectations of this kind were in the highest degree vain and absurd; though he had received intelligence (the general said) from a person lately arrived from America, in whose veracity, experience, and discernment, he could implicitly confide, that the people of that country, although in arms against us, were still anxious for the accomplishment of peace. He was also assured, that certain individuals, at no considerable distance, were empowered, on the part of the congress, to treat with the ministers of Great Britain for the attainment of so essential an object. These circumstances were not unknown to government; and a noble lord, who had lately retired from the office of secretary of state for the American department, had been particularly applied to on this intertelling occasion. What reason could the ministers assign why they had neglected to improve this singular advantage, and seemed to spurn at all ideas of negotiation? Could it be possible, that a series of ignominious miscarriages and defeats had not yet operated as a cure for the inhuman and destructive love of war? Such was the situation of the nation, that it behoved the ministers to negotiate for peace almost on any terms. But as they had hitherto done nothing of this kind, it was indispensably necessary that the parliament should interfere, and put an immediate end to a war so calamitous, so fatal, and so destructive. The motion was seconded by lord John Cavendish, who remarked, that the American war had been a war of malice and resentment, without either dignity in its conduct, probability in its object, or justice in its origin. It was, however, vigorously opposed by administration, who had still sufficient strength to gain their point, though only by a single vote, the motion being rejected by 194 to 193.

The increasing strength of opposition now showed that the downfall of ministry was at hand. The decision of the last question was considered as a victory

gained by the former; and Mr Fox instantly gave notice that the subject would be resumed in a few days, under another form. It was accordingly revived on the 27th of February; on which day a petition from the city of London was presented to the house, soliciting the house to interpose in such a manner as should prevent any farther prosecution of the American war; after which general Conway moved, that it should be resolved, "That it was the opinion of that house, that the farther prosecution of offensive war on the continent of North America, for the purpose of reducing the revolted colonies to obedience by force, would be the means of weakening the efforts of this country against her European enemies, and tend, under the present circumstances, dangerously to increase the mutual enmity so fatal to the interests both of Great Britain and America; and, by preventing a happy reconciliation with that country, to frustrate the earnest desire graciously expressed by his majesty to restore the blessings of public tranquillity."

In the speech by which he introduced this motion, the general took notice of some objections that had been made to his former motion, under the idea that it was unconstitutional in that house to interfere with its advice in those things which especially and indisputably belonged to the executive power. It appeared, however, from the journals, that from the days of Edward III. down to the present reign, parliament had at all times given advice to the crown in matters relating to war and peace. In the reign of Richard II. it was frequently done; and also in that of Henry IV. One remarkable instance of this was in the reign of Henry VII. when that prince consulted his parliament respecting the propriety of supporting the duke of Brittany against France, and also of declaring war against the latter; and he told his parliament, that it was for no other purpose than to hear their advice on these heads that he called them together. In the reign of James I. the parliament interfered repeatedly with their advice respecting the Palatinate, the match with Spain, and a declaration of war against that power. In the time of Charles I. there were similar interferences; and in the reign of his son Charles II. the parliament made repeated remonstrances, but particularly in 1674 and 1675, on the subject of the alliance with France, which they urged ought to be renounced, and at the same time recommended a strict union with the united provinces. To some of these remonstrances, indeed, answers were returned not very satisfactory; and the parliament were informed, that they were exceeding the line of their duty, and encroaching upon the prerogative of the crown. But so little did the commons of those days relish these answers, that they addressed the king to know who it was that had advised his majesty to return such answers to their loyal and constitutional remonstrances. In the reign of king William, repeated instances were to be found in the journals of advice given by parliament relative to the Irish war and the war on the continent. The like occurred frequently in the reign of queen Anne: that princess, in an address from the parliament, was advised not to make peace with France until Spain should be secured to Austria; and also, not to consent to peace until Dunkirk should be demolished. In short, it was manifest from the whole history

Britain.
665
Second motion for address.

666
Parliament has a right to advise the king.

of English parliaments. that it was ever considered as constitutional for parliament to interfere, whenever it thought proper, in all matters so important as those of peace and war. The general urged other arguments in support of his motion, which was seconded by lord Althorpe; and petitions from the mayor, burgesses, and commonalty of the city of Bristol, and from the merchants, tradesmen, and inhabitants of that city, against the American war, were read. In order to evade coming to any immediate determination on the question, a proposition was made by Mr Wallace, the attorney-general, that a truce should be entered into with America; and that a bill should be prepared to enable his majesty's ministers to treat on this ground: and under the pretence of allowing time for this measure, he moved, "that the present debate should be adjourned for a fortnight." The house divided upon this motion, when there appeared for it 215, and against it 234; so that there was a majority of 19 against the ministry. The original motion of general Conway was then put and carried without a division. The general immediately followed up his first motion with another for an address to the king, in which the American war was spoken of precisely in the same terms made use of in the motion, and in which his majesty was solicited to put a stop to any farther prosecution of offensive war against the colonies. This motion was agreed to; and it was also resolved, that the address should be presented to his majesty by the whole house. The address was accordingly presented on the first of March; when his majesty returned an answer, in which he declared, that there were no objects nearer to his heart than the ease, happiness, and prosperity of his people; that the house of commons might be assured, that, in pursuance of their advice, he should take such measures as should appear to him to be most conducive to the restoration of harmony between Great Britain and her revolted colonies, so essential to the prosperity of both; and that his efforts should be directed, in the most effectual manner, against our European enemies, until such a peace could be obtained as should consist with the interests and permanent welfare of his kingdoms. But though the proceedings of the house of commons, in addressing his majesty against any farther prosecution of the American war, gave general satisfaction, the royal answer, however, was not thought sufficiently explicit. It was therefore observed by general Conway, in the house of commons, on the 4th of March, that he hoped he should be supported by the house in his desire of securing the nation against the possibility of a doubt that the American war was not now completely concluded. Something, perhaps, might yet be wanting, by which ministers might be so expressly bound, that, however desirous of evasion, they would not have it in their power to evade the injunction of that house. He therefore moved, "That an humble address should be presented to his majesty, to return his majesty the thanks of that house for his gracious answer to their last address; that house being convinced, that nothing could, in the present circumstances of this country, so essentially promote those great objects of his majesty's paternal care for his people as the measures which his faithful commons had most humbly but earnestly recommended to his majesty."

This motion was unanimously agreed to; after which the general made a second motion, that it should be resolved by that house, "That, after the solemn declaration of the opinion of that house, in their humble address presented to his majesty on Friday last, and his majesty's assurance of his gracious intention, that his house would consider as enemies to his majesty and this country, all those who should endeavour to frustrate his majesty's paternal care for the ease and happiness of his people, by adding, or by any means attempting, the farther prosecution of offensive war on the continent of North America, for the purpose of reducing the revolted colonies to obedience by force." After some debate, the motion was agreed to without a division; and on the 6th of the month, after a number of papers had been read in the house of 435 relative to the surrender of earl Cornwallis and the army under his command, the two following motions were made by the duke of Chandos. First, "That it was the opinion of that house, that the immediate cause of the capture of the army under earl Cornwallis in Virginia, appeared to have been the want of a sufficient naval force to cover and protect the same." Secondly, "That the not covering and protecting the army under earl Cornwallis, in a proper manner, was highly blameable in those who advised and planned the expedition." After some debate, the motion were rejected, upon a division, by a majority of 72 to 37. Thus the ministry still kept their ground, and with the most astonishing resolution combated the powers of opposition, which were daily increasing. On the 8th of March several resolutions were moved by lord John Cavendish; one of which was, that "the chief cause of all the national misfortunes was the want of foresight and ability in his majesty's ministers." Another respected the immense sum expended on the war, which was not denied to be less than 100 millions. The expensiveness of this sum became an object of severe scrutiny; but still all inquiry was frustrated. Mr Burke affirmed, that all public documents relative to the finances, exhibited the mismanagement, profusion, and enormities, of an unprincipled administration; as an instance of which he adduced the presents given to the Indians for their services during the last year, amounting to no less than 100,000*l*. Several other particulars were pointed out; but the motions were lost by 220 to 216.

The unpopularity of lord North was now farther augmented by his proposal of some new taxes, particularly on soap, the carriage of goods, and pieces of entertainment. Opposition therefore still determined to force him to resign; which indeed it seemed impossible that he would voluntarily do. On the 15th of March it was moved by the lord Rokeby, that "the nation could have no farther confidence in the ministers who had the conduct of public affairs." The debate was remarkable for an argument, in the affair of America, perfectly original, and unrecited in all that had been said or written on the subject. Sir James Marriot informed the house, that the king had been frequently presented, that the inhabitants of the colonies were not represented in the British parliament, yet the fact was odious; for they were actually represented. The first colonization, by national and foreign authority, is remarkable, was that of the West

tain. of English parliaments. that it was ever considered as constitutional for parliament to interfere, whenever it thought proper, in all matters so important as those of peace and war. The general urged other arguments in support of his motion, which was seconded by lord Althorpe; and petitions from the mayor, burgesses, and commonalty of the city of Bristol, and from the merchants, tradesmen, and inhabitants of that city, against the American war, were read. In order to evade coming to any immediate determination on the question, a proposition was made by Mr Wallace, the attorney-general, that a truce should be entered into with America; and that a bill should be prepared to enable his majesty's ministers to treat on this ground: and under the pretence of allowing time for this measure, he moved, "that the present debate should be adjourned for a fortnight." The house divided upon this motion, when there appeared for it 215, and against it 234; so that there was a majority of 19 against the ministry. The original motion of general Conway was then put and carried without a division. Britain.

the colony of Virginia. The grants and charters made of those lands, and of all the subsequent colonies, were of one tenor, and expressed in the following terms: "To have and to hold of the king or queen's majesty, as part and parcel of the manor of East Greenwich, within the county of Kent, *reddendum*, a certain rent at our castle of East Greenwich, &c." So that the inhabitants of America were, in fact, by the nature of their tenure, represented in parliament by the knights of the shire for the county of Kent. This curious legal discovery, that the American colonies were part and parcel of the manor of East Greenwich, though delivered by the learned judge with all proper gravity and solemnity, yet excited to much merriment in the house, that it was with great difficulty, for some time, that the speaker could preserve any kind of order.

673

Lord North's defence of his own conduct.

Lord North endeavoured to vindicate his own administration. He affirmed, that it could not be declared with truth, by that house, that the national calamities originated from the measures of the present administration. The repeal of the American stamp-act, and the passing of the declaratory law, took place before his entrance into office. As a private member of parliament, he gave his vote in favour of both; but, as a minister, he was not responsible for either. When he accepted his post, the times were scarcely less violent than the present. He approached the helm when others had deserted it; and, standing there, he had used his utmost efforts to assist his country. That the American war was just and requisite, and prosecuted for the purpose of supporting and maintaining the rights of the British legislature, was a position, for the truth of which he would ever contend, whilst he enjoyed the power of arguing at all upon the subject. As to peace, he not only wished most earnestly for it, but also for the formation of such a ministry as might at once prove welcome to the country, and with unanimous cordiality co-operate for the welfare and the honour of the state. It was not an attachment to the honours and emoluments of office which had kept him so long in place; and he should disdain to throw impediments in the way of any honourable and salutary coalition of parties, though for the adjustment of an administration from which he might perceive himself excluded. The house at length divided upon the question, when there appeared for it 227, and against it 236; so that there was a majority of nine in favour of administration.

674

The ministers at last quit their places.

Notwithstanding this seemingly favourable determination, it was so well known that the ministry could not stand their ground, that, four days after, a similar motion to that made by Sir John Rous was to have been made by the earl of Surrey; but when his lordship was about to rise for that purpose, lord North addressed himself to the speaker, and endeavoured to gain the attention of the house. This occasioned some altercation, it being contended by many members, that the earl of Surrey ought to be heard first. But lord North being at length suffered to proceed, he observed, that as he understood the motion to be made by the noble earl was similar to that made a few days before, and the object of which was the removal of the ministers, he had such information to communicate to the house, as must, he conceived, render any such motion now unnecessary. He could with authority assure the

Nº 8.

house, that his majesty had come to a full determination to change his ministers. Indeed, those persons who had for some time conducted the public affairs were no longer his majesty's ministers. They were not now to be considered as men holding the reins of government, and transacting measures of state, but merely remaining to do their official duty, till other ministers were appointed to take their places. The sooner those new ministers were appointed, his lordship declared, that, in his opinion, the better it would be for the public business, and the general interests of the nation. He returned thanks to the house for the many instances of favour and indulgence which he had received from them during the course of his administration; and he declared, that he considered himself as responsible, in all senses of the word, for every circumstance of his ministerial conduct, and that he should be ready to answer to his country whenever he should be called upon for that purpose.

The earl of Surrey informed the house, that the motion which he intended to have made was designed to declare to the nation, and to all Europe, that the ministry were not dismissed because they wanted to avoid the fatigues of office, but because the parliament had totally withdrawn from them their good opinion and their confidence, and were determined no longer to permit the perpetration of those violent abuses of their trust, to which, with impunity, and to the disgrace and detriment of the state, they had for such a length of time proceeded. His lordship, however, agreed, in consequence of the declaration of lord North, to wave his intended motion; and, after some farther debate, the house adjourned.

Thus an end was put to an administration which had for so long been obnoxious to a great part of the nation, and whose removal contributed very much to allay those dangerous ferments by which every part of the British dominions had been so long agitated. Peace now became as much the object of ministry as war had been formerly. Before we proceed to any account of the negotiations for that desirable event, however, it will be necessary to take notice of those military events which disposed the other belligerent powers to an accommodation. The bad success of Britain in America has been already taken notice of. The disaster of Cornwallis had produced a sincere desire of being at peace with America: but that could not be accomplished without making peace with France also; and that power was haughty and elated with success. Minorca had now fallen into the hands of the Spaniards; and though it is certain that the capture of a few miserable invalids, attended with such extreme difficulty as the Spaniards experienced †, ought rather to have intimidated them than otherwise, they now projected the most important conquests. Nothing less than the entire reduction of the British West India islands became the object of the allies; and indeed there was too much reason to suppose that this object was within their reach. In the beginning of the year 1782, the islands of Nevis and St Christopher were obliged to surrender to M. de Grasse the French admiral, and the marquis de Bouille, who had already signalized himself by several exploits*. Jamaica was marked out as the next victim; but an end of all these aspiring hopes was fast approaching. The advantages

hitherto

Britain.

hitherto gained by the French in their naval engagements with the British fleet, had proceeded from their keeping at a great distance during the time of action, and from their good fortune and dexterity in gaining the wind. At last, the French admiral, de Grasse, probably prompted by his natural courage, determined, after an indecisive action on the 9th of April 1782, to stand a close engagement with his formidable antagonist admiral Rodney. This, with him, appears to have been a matter of choice, as he interfered to prevent the loss of a disabled ship, by parting with which he might have avoided the disaster that followed. This memorable engagement took place off the island of Dominica, three days after the former. The British fleet consisted of 37 ships of the line, and the French of 34. The engagement commenced at seven o'clock in the morning, and continued with unremitting fury till half past six in the evening. It is said, that no other signal was made by the admiral but the general one for action, and that for close fight. Sir George Rodney was on board the Formidable, a ship of ninety guns; and the count de Grasse was on board the Ville de Paris, a ship of 110 guns, which was a present to the French king from the city of Paris. In the course of the action, the Formidable fired nearly 80 broadsides; and for three hours the admiral's ship was involved in so thick a cloud of smoke, that it was almost invisible to the officers and men of the rest of the fleet. The van division of the British fleet was commanded by Sir Samuel Hood, and the rear division by rear-admiral Drake; and both these officers greatly distinguished themselves in this important action. But the decisive turn on this memorable day was given by a bold manœuvre of the Formidable, which broke the French line, and threw them into confusion. The first French ship that struck was the Cæsar, a 74 gun ship, the captain of which fought nobly, and fell in the action. It is said, that, when she struck, she had not a foot of canvas without a shot-hole. Unfortunately, soon after she was taken possession of, she took fire by accident, and blew up, when about 200 Frenchmen perished in her, together with an English lieutenant and ten English seamen. But le Glorieux and le Hector, both 74 gun ships, were also taken by the British fleet; together with l'Ardent of 64 guns; and a French 74 gun ship was also sunk in the engagement. It was a very close and hard fought action on both sides, but the French fleet was at length totally defeated. It was almost dark when the Ville de Paris struck, on board which the count de Grasse had fought very gallantly. Five thousand five hundred troops were on board the French fleet, and the havoc among these was very great, as well as among the French seamen. The British had 230 killed and 759 wounded. Captain Blair, who commanded the Anson, and several other officers, were killed in the action; and lord Robert Manners, who commanded the Resolution, died of his wounds on his return home. On the 19th of the same month, a squadron which was detached from the main-fleet, under the command of Sir Samuel Hood, captured the Cato and the Jason, two French men of war of 63 guns each, and also l'Aimable of 32 guns, and the Ceres of 18. About the same time also the fleet under admiral Barington took from the French, off Ullant,

le Pegase of 74 guns, l'Actionnaire of 64, and ten sail of vessels under their convoy.

It was universally allowed, that in this engagement the French, notwithstanding their defeat, behaved with the greatest valour. De Grasse himself did not surrender till 400 of his people were killed, and only himself and two others remained without a wound. The captain of the Cæsar, after his insignifical was shot away, and the ship almost battered to pieces, caused his colours to be nailed to the mast, and thus continued fighting till he was killed. The vessel, when taken, was a mere wreck. Other French officers behaved in the same manner. The valor of the British requires no encomium; it was evident from their success.

This victory was a very fortunate circumstance both for the interest and reputation of the British admiral. Before this event, the new ministry had appointed admiral Pigot to supersede him in the command in the West Indies; and it was understood, that they meant to set on foot a rigid inquiry into the transactions at St Eustatius. But the splendor of his victory put an end to all thoughts of that kind: he received the thanks of both houses of parliament for his services; and was created an English peer, by the title of baron Rodney, of Rodney-Stoke, in the county of Somerset. Sir Samuel Hood was also created baron Hood of Catherington, in the kingdom of Ireland; and rear-admiral Drake, and captain Ansell, were created baronets of Great Britain. Some attempts were also made, in the house of commons, to procure a vote of censure against the new ministry, for having recalled lord Rodney; but the motions made for this purpose were rejected by the majority.

The count de Grasse, after his defeat, was received on board the Buffleur man of war, and afterward, landed on the island of Jamaica, where he was treated with great respect. After continuing there some time, he was conveyed to England, and accommodated with a suite of apartments at the Royal Hotel in Pall-mall. His sword, which he had delivered up, according to the usual custom, to admiral Rodney, was returned to him by the king. This etiquette enabled him to appear at court, where he was received by their majesties and the royal family in a manner suitable to his rank. From the time of his arrival in London to his departure, which was on the 12th of August 1782, he was visited by many persons of the first fashion and distinction, and was much employed in paying visits to the great officers of state, and some of the principal nobility of the kingdom, by whom he was entertained in a very sumptuous and hospitable style. He received, indeed, every mark of civility which the British nation could bestow; and was treated with much respect even by the common people, from the opinion that was generally entertained of his valour and merit.

Though the designs of the French against Jamaica were now effectually frustrated, the victory was not followed by those beneficial consequences which by many were expected. None of the British islands which had been taken by the French in the West Indies were afterward recaptured; though it was hoped that this would have been the result of our naval superiority in those seas. It was also an unfortunate circumstance, that some of those ships which were taken

2007

676
de Grasse
entirely de-
feated and
taken pri-
mer by
admiral
Rodney.

by admiral Rodney were afterwards lost at sea; particularly the Ville de Paris, Gloieux, and Hector. A British man of war, the Centaur, of 74 guns, was also sunk in lat. 48 deg. 33 min. and long. 43 deg. 20 min. on the 24th of September 1782, in consequence of the disabled state to which it was reduced by some very violent storms. Before the ship sunk, the officers and crew had sustained great hardships: most of them at last went down with the ship; but the lives of captain Inglefield the commander, and ten other officers and seamen, were preserved by their getting on board a pinnace. But even this was leaky; and when they went into it they were nearly in the middle of the Western ocean, without compass, quadrant, great coat or cloak; all very thinly clothed, in a gale of wind, and with scarcely any provisions. After undergoing extreme hardships and fatigues for 16 days, they at length reached the island of Fayall, one of the Azores. They were so much reduced by want of food and incessant labour, that, after they had landed, some of the stoutest men belonging to the Centaur were obliged to be supported through the streets of Fayall. The Jamaica homeward bound fleet were also dispersed this year by a hurricane off the banks of Newfoundland, when the Ramillies of 74 guns and several merchantmen foundered.

The British navy also sustained, about this time, a considerable loss at home, by the Royal George, of 100 guns, being overset and sunk at Portsmouth. This melancholy accident, which happened on the 29th of August, was occasioned by a partial heel being given to the ship, with a view to cleanse and sweeten her; but the guns on one side being removed to the other, or at least the greater part of them, and her lower deck ports being not lashed in, and the ship thwarting on the tide with a squall from the north-west, it filled with water, and she sunk in the space of about three minutes. Admiral Kempenfelt, a very brave and meritorious officer, other officers, upwards of 400 seamen and 200 women, besides many children, perished in her.

677
Hudson's
bay and the
Bahama
islands re-
duced.

Thus the prosecution of the war seemed to be attended with endless disasters and difficulties to all parties. The signal defeat above mentioned not only secured the island of Jamaica effectually from the attempts of the French, but prevented them from entertaining any other project than that of distressing the commerce of individuals. In the beginning of May an expedition was undertaken to the remote and inhospitable regions of Hudson's Bay; and though no force existed in that place capable of making any resistance, a 74 gun ship and two 36 gun frigates were employed on the service. All the people in that part of the world either fled or surrendered at the first summons. The loss of the Hudson's bay company, on this occasion, amounted to 500,000 l. but the humanity of the French commander was conspicuous in leaving a sufficient quantity of provisions and stores of all kinds for the use of the British who had fled at his approach.

Another expedition was undertaken by the Spaniards to the Bahama islands, where a like easy conquest was obtained. The island of Providence was defended only by 360 men, who being attacked by 5000, could make no resistance. A very honourable capitulation

was granted by the victors, who likewise treated the garrison with great kindness afterwards. Some settlements on the Mosquito shore were also taken by the Spaniards: but the Bay-men, assisted by their negroes, bravely retook some of them; and having formed a little army with the Indians in those parts, headed by colonel Despard, they attacked and carried the posts on the Black River, making prisoners of about 800 Spanish troops. The great disaster which befel this power, however, was their failure before Gibraltar, which happened in the month of September 1782, with such circumstances of horror and destruction, as evinced the absurdity of persisting in the enterprise. Thus all parties were taught that it was high time to put an end to their contests. The affair of Cornwallis had shown that it was impossible for Britain to conquer America; the defeat of de Grasse had rendered the reduction of the British possessions in the West Indies impracticable by the French; the final repulse before Gibraltar, and its relief afterwards by the British fleet †, put an end † See Gibraltar. to that favourite enterprise, in which almost the whole strength of Spain was employed; while the engagement of the Dutch with admiral Parker showed them that nothing could be gained by a naval war with Britain.

We have already taken notice, as fully as the limits of this article would admit, of the events which led to the removal of lord North and the other ministers who for so long time had directed public measures in this kingdom. On this occasion it was said that his majesty expressed a considerable agitation of mind at being in a manner compelled to make such an entire change in his councils: for the members in opposition would form no coalition with any of the old ministry, the lord chancellor only excepted. On the 27th and 30th of March 1782, the marquis of Rockingham was appointed first lord of the treasury; lord John Cavendish chancellor of the exchequer; the earl of Shelburne and Mr Fox principal secretaries of state; lord Camden president of the council; the duke of Richmond master of the ordnance; the duke of Grafton lord privy-seal; admiral Keppel first lord of the admiralty; general Conway commander in chief of all the forces in Great Britain; Mr Thomas Townshend secretary at war; Mr Burke paymaster of the forces; and colonel Barré treasurer of the navy. Other offices and honours were likewise conferred on different members of the opposition; and some were raised to the peerage, particularly admiral Keppel, Sir Fletcher Norton, and Mr Dun-

679
Change of
ministry in
Britain.

The first business in which the new ministry engaged, was the taking such measures as were proper to effectuate a general peace. No time was lost in the pursuit of this great object, or in taking the necessary steps for its attainment. Accordingly, the empress of Russia having offered her mediation, in order to restore peace between Great Britain and Holland, Mr secretary Fox, within two days after his entrance into office, wrote a letter to Mons. Simolin, the Russian minister in London, informing him, that his majesty was ready to enter into a negotiation for the purpose of settling on foot a treaty of peace, on the terms and conditions of that which was agreed to in 1674 between his majesty and the republic of Holland; and that, in

680
Negotia-
tions for
peace.

Britain. order to facilitate such a treaty, he was willing to give immediate orders for a suspension of hostilities, if the states-general were disposed to agree to that measure.

But the states of Holland did not appear inclined to a separate peace; nor perhaps would it have been agreeable to the principles of sound policy, if they had agreed to any propositions of this kind. However, immediately after the change of ministry, negotiations for a general peace were commenced at Paris. Mr Grenville was invested with full powers to treat with all the parties at war; and was also directed to propose the independency of the 13 United Provinces of America, in the first instance, instead of making it a condition of a general treaty. Admiral Digby and general Carleton were also directed to acquaint the American congress with the pacific views of the British court, and with the offer that was made to acknowledge the independency of the United States.

681

Death of the marquis of Rockingham occasions new changes in the ministry.

But before this work of pacification had made any considerable progress, the new ministry sustained an irreparable loss by the death of the marquis of Rockingham in July 1782. Even before this event, considerable apprehensions were entertained of their want of union; but the death of the nobleman just mentioned occasioned an absolute dissolution. The earl of Shelburne, who succeeded him as first lord of the treasury, proved so disagreeable to some of his colleagues, that Mr Fox, lord John Cavendish, Mr Burke, Mr Frederic Montagu, and two or three others, instantly resigned their places. Others, however, though little attached to the earl, kept their places; and his lordship found means to attach to his interest Mr William Pitt, son to the late earl of Chatham. Though then in an early stage of life, that gentleman had distinguished himself greatly in parliament, and was now prevailed upon to accept the office of chancellor. The seceding members of the cabinet were at great pains to explain their motives to the house for taking this step. There were in general a suspicion that matters would be managed differently from the plan they had proposed while in office, and particularly that American independence would not be allowed; but this was positively denied at the time; and with truth, as appeared by the event. There appeared indeed a duplicity in the conduct of the earl of Shelburne not easily to be accounted for. Even after it had been intimated by general Carleton and admiral Digby, that the independency of the united provinces should be granted by his majesty in the first instance, instead of making it a condition of a provisional treaty, his lordship expressed himself to the following purpose: "He had formerly been, and still was of opinion, that whenever the independency of America was acknowledged by the British parliament, the sun of England's glory was set for ever. This had been the opinion of lord Chatham and other able statesmen; nevertheless, as the majority of the cabinet were of a contrary opinion, he acquiesced in the measure, though his ideas were different. He did not wish to see England's sun set for ever, but looked for a spark to be left which might light us up a new day. He wished to God that he had been deputed to congress, that he might plead the cause of America as well as Britain. He was convinced that the liberties of the former were gone as soon as the independency of the states was allowed; and he con-

682

Strange speech of lord Shelburne on American independence

cluded his speech with observing, that he was not afraid of his expressions being repeated in America; there being great numbers there who were of the same opinion with him, and perceived ruin and independency linked together."

Britain.

If his lordship really was of opinion that his oratorical powers were able to persuade the Americans out of a system for which they had fought so desperately for a number of years, it is much to be feared he over-rated them. No objection, however, arose to the general pacification. As early as November 23rd 1782, the articles of a provisional treaty were settled between Britain and America. By these it was stipulated, that the people of the united states should continue to enjoy, without molestation, the right to take fish of every kind on the grand bank, and on all the other banks of Newfoundland; and that they should likewise exercise and continue the same privilege in the gulph of St Lawrence, and at every other place in the sea, where the inhabitants used heretofore to fish. The inhabitants of the united states were likewise to have the liberty to take fish of every kind on such part of the coast of Newfoundland as British seamen shall resort to; but not to cure or dry them on that island. They were also to possess the privilege of fishing on the coasts, bays, and creeks of all the other dominions of his Britannic majesty in America; and the American fishermen were permitted to cure and dry fish in any of the unsettled bays, harbours, and creeks of Nova Scotia, Magdalen islands, and Labrador. But it was agreed, that, after such places should be settled, this right could not be legally put in practice without the consent of the inhabitants and proprietors of the ground. It was accorded, that creditors upon either side should meet with no impediment in the prosecution of their claims. It was contracted that the congress should earnestly recommend it to the legislatures of the respective states, to provide for the restitution of all estates and property which had been confiscated, belonging to real British subjects, and of the estates and properties of persons resident in districts in the possession of his majesty's arms, and who had not borne arms against the united states. It was resolved, that persons of any other description should have free liberty to go to any part whatsoever of any of the thirteen united states, and remain in it for twelve months unmolested in their endeavours to recover such of their estates, rights, and properties as might not have been confiscated; and it was concerted that the congress should earnestly recommend to the several states a revision of all acts or laws regarding the premises, so as to render them perfectly consistent, not only with justice and equity, but with that spirit of conciliation which, on the return of the blessings of peace, should universally prevail. It was understood that no future confiscations should be made, nor prosecutions commenced against any person, or body of men, on account of the part which he or they had taken in the present war; and that those who might be in confinement on such a charge, at the time of the ratification of the treaty in America, should be immediately set at liberty. It was concluded that there should be a firm and perpetual peace between his Britannic majesty and the united states; that all hostilities by sea and land should immediately cease; and that prisoners on both sides should

Britain.

should be set at liberty. It was determined that his Britannic majesty should expeditiously, and without committing destruction of any sort, withdraw all his armies, garrisons, and fleets, from every port, place, and harbour of the united states. The navigation of the river Mississippi, from its source to the ocean, was to remain for ever free and open to the subjects of Great Britain and the citizens of the united states. In fine, it was agreed in the event, that if any place or territory belonging to Great Britain, or to the united states, should be conquered by the arms of either before the arrival of the provisional articles in America, it should be restored without compensation or difficulty.

685
Preliminary
articles
with
France ;

In the treaty between Great Britain and France, it was agreed that Newfoundland should remain with England, as before the commencement of the war; and, to prevent disputes about boundaries, it was accorded that the French fishery should begin from Cape St John on the eastern side, and going round by the north, should have for its boundary Cape Ray on the western side. The islands of St Pierre and Miquelon, which had been taken in September 1778, were ceded in full right to France. The French were to continue to fish in the gulph of St Laurence, conformably to the fifth article of the treaty of Paris. The king of Great Britain was to restore to France the island of St Lucia, and to cede and guaranty to her that of Tobago. The king of France was to surrender to Great Britain the islands of Grenada and the Grenadines, St Vincent, Dominica, St Christopher's, Nevis, and Mountferrat. The river of Senegal and its dependencies, with the forts of St Louis, Podor, Galam, Arguin, and Portendic, were to be given to France; and the island of Goree was to be restored to it. Fort James and the river Gambia were guarantied to his Britannic majesty; and the gum trade was to remain in the same condition as before the commencement of hostilities. The king of Great Britain was to restore to his most Christian majesty all the establishments which belonged to him at the breaking out of the war on the coast of Orixa and in Bengal, with the liberty to surround Chandernagor with a ditch for draining the waters; and became engaged to secure to the subjects of France in that part of India, and on the coasts of Orixa, Coromandel, and Malabar, a safe, free, and independent trade, either as private traders, or under the direction of a company. Pondicherry, as well as Karical, was to be rendered back to France; and his Britannic majesty was to give as a dependency round Pondicherry the two districts of Valanour and Bahour; and as a dependency round Karical, the four contiguous Magans. The French were again to enter into the possession of Mahe, and of the Comptoir at Surat. The allies of France and Great Britain were to be invited to accede to the present pacification; and the term of four months was to be allowed them, for the purpose of making their decision. In the event of their aversion from peace, no assistance on either side was to be given to them. Great Britain renounced every claim with respect to Dunkirk. Commissioners were to be appointed respectively by the two nations to inquire into the state of their commerce, and to concert new arrangements of trade on the footing of mutual convenience. All conquests on either side, in any part of the world whatsoever, not mentioned nor

Britain.

alluded to in the present treaty, were to be restored without difficulty, and without requiring compensation. It was determined that the king of Great Britain should order the evacuation of the islands of St Pierre and Miquelon, three months after the ratification of the preliminary treaty; and that, if possible, before the expiration of the same period, he should relinquish all connection with St Lucia in the West Indies, and Goree in Africa. It was stipulated in like manner, that his Britannic majesty should, at the end of three months after the ratification of the treaty, or sooner, enter into the possession of the islands of Grenada and the Grenadines, St Vincent, Dominica, St Christopher's, Nevis, and Mountferrat. France was to be put into possession of the towns and comptoirs which were to be restored to her in the East Indies, and of the territories which were to serve as dependencies round Pondicherry and round Karical, six months after the ratification of the definitive treaty; and at the termination of the same term she was to restore the towns and districts which her arms might have taken from the English or their allies in that quarter of the globe. The prisoners upon each side were reciprocally to be surrendered, and without ransom, upon the ratification of the treaty, and on paying the debts they might have contracted during their captivity. Each crown was respectively to reimburse the sums which had been advanced for the maintenance of their prisoners by the country where they had been detained, according to attested and authentic vouchers. With a view to prevent every dispute and complaint on account of prizes which might be made at sea after the signing of the preliminary articles, it was mutually settled and understood that the vessels and effects which might be taken in the Channel, and in the North seas, after the space of twelve days, to be computed from the ratification of the present preliminary articles, were to be restored upon each side; that the term should be one month from the Channel and the North seas, as far as the Canary islands inclusively, whether in the ocean or the Mediterranean; two months from the Canary islands as far as the equinoctial line or equator; and lastly, five months without exception in all other parts of the world.

These preliminary articles of peace were concluded at Versailles on the 20th of January 1783, between Mr Alleyne Fitzherbert, minister plenipotentiary on the part of his Britannic majesty, and Charles Gravier, comte de Vergennes, the minister plenipotentiary on the part of the king of France. At the same time the preliminary articles of peace between Great Britain and Spain were also concluded at Versailles between Mr Fitzherbert and the comte d'Aranda, the minister plenipotentiary for the Spanish monarch. It was agreed that a sincere friendship should be re-established between his Britannic majesty and his Catholic majesty, their kingdoms, states, and subjects by sea and land in all parts of the world. His Catholic majesty was to keep the island of Minorca; and was to retain West Florida. East Florida was to be ceded to him by the king of Great Britain. Eighteen months from the date of the ratification of the definitive treaty were to be allowed to the subjects of the latter who had settled in the island of Minorca and in the two Floridas, to sell their estates, to recover their debts, and to trans-

686
With Spain.

port their persons and effects, without being restrained upon account of their religion, or on any other pretence whatsoever, except that of debts, and prosecutions for crimes. His Britannic majesty was, at the same time, to have the power to cause all the effects that might belong to him in East Florida, whether artillery or others, to be carried away. The liberty of cutting logwood in a district of which the boundaries were to be ascertained, without molestation or disturbance of any kind whatsoever, was permitted to Great Britain. The king of Spain was to restore the islands of Providence, and the Bahamas, without exception, in the condition in which they were when they were conquered by his arms. All other conquests of territories and countries upon either side, not included in the present articles, were to be mutually restored without difficulty or compensation. The epoch for the restitutions to be made, and for the evacuations to take place, the regulations for the release of prisoners, and for the cessation of captures, were exactly the same as those which have already been related, as stipulated in the preliminary articles with France.

No sooner were these articles ratified and laid before parliament, than the most vehement declamations against ministry took place. Never had the administration of lord North himself been arraigned with more asperity of language. The ministry defended themselves with great resolution; but found it impossible to avoid the censure of parliament. An address without any amendment was indeed carried in the house of lords by 72 to 59; but in the lower house it was lost by 224 to 208. On the 21st of February, some resolutions were moved in the house of commons by lord George Cavendish, of which the most remarkable were, that the concessions made by Britain were greater than its adversaries had a right to expect; and that the house would take the case of the American loyalists into consideration. The last motion indeed his lordship contented to wave; but all the rest were carried against ministry by 207 to 190. These proceedings, however, could make no alteration with regard to the treaty, which had already been ratified by all the contending powers, the Dutch only excepted. The terms offered them were a renewal of the treaty of 1674; which, though the most advantageous they could possibly expect, were positively refused at that time. Afterwards they made an offer to accept the terms they had formerly refused; but the compliment was then returned by a refusal on the part of Britain. When the preliminary articles were settled with the courts of France and Spain, a suspension of arms took place with Holland also; but though the definitive arrangements with the other powers were finally concluded by the month of September, it was not till then that the preliminary articles were settled with Holland. The terms were a general restitution of all places taken on both sides during the war, excepting only the settlement of Negapatnam in the East Indies, which was to remain in the hands of Britain, unless an equivalent was given on the part of Holland. The navigation of the eastern seas was to remain free and unmoled to all the British shippings. The other articles concerned only the exchange of prisoners, and such other matters as are common to all treaties.

Thus an end was put to the most dangerous war in which Britain was ever engaged; and in which, notwithstanding the powerful combination against her, she still remained in a state of superiority to all her enemies. At that time, and ever since, it has appeared how much the politicians were mistaken who imagined that the prosperity of Britain depended in a great measure on her colonies: Though for a number of years she had not only been deprived of these colonies, but opposed by them with all their force; though attacked at the same time by three of the greatest powers in Europe, and looked upon with an invidious eye by all the rest; the damages done to her enemies still greatly exceeded those she had received. Their trade by sea was almost ruined; and on comparing the loss of ships on both sides, the balance in favour of Britain was 28 ships of the line and 37 frigates, carrying in all near 2000 guns. Notwithstanding this, however, the state of the nation appears to have been really such, that a much longer continuance of the war would have been impracticable. In the debates, which were kept up with the greatest violence on account of the peace, Mr Pitt set forth our situation with great energy and strength of argument. "It was in vain (he said) to boast of the strength of our navy; we had not more than 100 sail of the line; but the fleet of France and Spain amounted nearly to 140 ships of the line. A destination of 72 ships of the line was to have acted against Jamaica. Admiral Pigot had only 46 sail to support it; and it was a favourite maxim of many members of the house, that defensive war must terminate in certain ruin. It was not possible that admiral Pigot could have acted offensively against the islands of the enemy; for lord Rodney, when flushed with victory, did not dare to attack them. Would admiral Pigot have recovered by arms what the ministers had regained by negociation? With a superior fleet against him, and in its fight, is it to be conceived that he could have retaken Grenada, Dominica, St Christopher's, Nevis, and Montserrat? On the contrary, is it not more than probable that the campaign in the West Indies must have terminated in the loss of Jamaica?"

"In the east, it was true that the services of Sir Edward Hughes had been highly extolled; but he could only be commended for a merely defensive resistance. Victory seemed to be out of the question; and he had not been able to prevent the disembarkation of a powerful European armament which had joined itself to Hyder Ally, and threatened the destruction of the Carnatic. At home and in our own seas the fleets of the enemy would have been nearly double to ours. We might have seized the intervals of their cruise, and paraded the channel for a few weeks; but that parade would have only served to disgrace us. It was yet the only achievement in our power; for to have hazarded an engagement would have been equivalent to a surrender of the kingdom."

"Neither, in his opinion, was the state of our army to be considered as formidable. New York could not be raised in a despotic country. We might send upon an offensive scheme five or six thousand men; and what expectation could be excited by a loss of this kind? To have withdrawn troops from America was a political game. There were no transports in which they

Britain. might be embarked; and if it had been possible to embark them, in what miraculous manner were they to be protected against the fleets of the enemy?

"As to our finances, they were melancholy. Let the immense extent of our debts be weighed; let our resources be considered; and let us then ask, what would have been the consequence of the protraction of the war? It would have endangered the bankruptcy of public faith; and this bankruptcy, it is obvious, if it had come upon us, might have dissolved all the ties of government, and have operated to the general ruin.

"To accept the peace on the terms already related, or to continue the war, was the only alternative in the power of ministers. Such was the *ultimatum* of France: At the same time, however, it ought to be remembered, that the peace obtained was better than could have been expected from the lowlands of our condition. We had acknowledged the American independence; but what was that but an empty form? We had ceded Florida; but had we not obtained the islands of Providence and the Bahamas? We had granted an extent of fishery on the coast of Newfoundland; but had we not established an exclusive right to the most valuable banks? We had restored St Lucia, and given up Tobago; but had we not regained Grenada, Dominica, St Christopher's, Nevis, and Montserrat? And had we not rescued Jamaica from inevitable danger. In Africa we had given Goree; but Goree was the grave of our countrymen; and we had secured Fort James and the river Gambia, the best and the most healthy settlement. In Europe we had relinquished Minorca; but Minorca is not tenible in war, and in peace it must be supported at a ruinous expence. We had permitted the reparation of the port of Dunkirk; but Dunkirk could only be an object when ships of a far inferior draught to the present were in use; the change in the operations of naval war had taken away its importance. In the East Indies cessions had been made; but let it be remarked that these cessions are inconsiderable in themselves, and could not be protected by us in the event of hostilities. In fine, it was objected, that we had abandoned the unhappy loyalists to their implacable enemies. What is this but to impute to congress by anticipation a violence which common decency forbids us to expect? But let it be considered, that the principle of assisting these unfortunate men would not have justified ministers to have continued the war. And let it be considered, that a continuation of the war would not have procured them any certain indemnity. The accumulation of our distresses must have added to theirs. A year or two hence, harder terms of peace might have been forced upon our acceptance. Their fate then must have been desperate indeed! But as matters were now situated, there were hopes of mercy and reconciliation."

691
A general distrust and suspicion of treachery prevailed during the war.

Having thus given as full an account as our limits would allow of the great national events to the conclusion of the peace in 1783, we shall now give a detail of some others, which though of sufficient importance to deserve notice, could not without interrupting the narrative. It has repeatedly been observed, that thro' the violence of parties, a general temper of distrust and suspicion took place throughout the nation, insomuch that the most improbable stories with respect to individuals began to gain credit, of which an instance was

given in the case of Mr Sayre. From certain circumstances, however, it appeared, that there undoubtedly were persons in the kingdom who wished if possible to destroy the national strength in such a manner as to render it impossible for us to make head against the attempts of our enemies. On the 8th of December 1776, a fire broke out in the ropehouse of the dock-yard at Portsmouth, which totally consumed it, but without doing any very material damage. For some time the affair passed as an accident; but in clearing away the rubbish, a tin-box was found with a wooden bottom, containing matches which had been lighted, and underneath was a vessel with spirit of wine: however, the fire not having been properly supplied with air, had extinguished of itself before it touched the spirit of wine. Had it caught fire, all the stores in the storehouse, sufficient to rig out 50 sail of men of war, would have been destroyed. In the beginning of the year 1777, a fire happened at Bristol, which consumed six or seven warehouses; and by the finding of machines similar to those already mentioned, it was evident that the fire had not been accidental. The terror of the public was now greatly increased, and the most violent accusations against each other were thrown out by the ministerial and popular parties. On this point, however, they soon came to a right understanding, by the discovery of the author of all this mischief. This was one James Aitken, *alias* John the Painter, a native of Edinburgh. Having been from his early years accustomed to a vagrant life, to which indeed his profession naturally led him, he had gone through many different adventures. He had enlisted as a soldier, deserted, and when pinched by want made no scruple of betaking himself to the highway or committing thefts. Having traversed a great part of America, he there imbibed the prejudices against Britain to such a degree, that he at last took the extraordinary resolution of singly overturning the whole power of the nation. This he was to accomplish by setting on fire the dockyards at Portsmouth and Plymouth, and afterwards the principal trading towns of the nation. With this view, he inspected with the utmost care those docks and other places on which his attempts were to be made, in order to learn with what care they were guarded. This he found in general as negligent as he could wish; and indeed had he not been some way or other very deficient in the construction of his machines, he must certainly have done a great deal of mischief: for as his attempts were always discovered by finding his machines, it was apparent that he had met with abundance of opportunities.

For some time the affair at Portsmouth passed, as has already been mentioned, for an accident. It was soon recollected, however, that a person had been seen loitering about the rope-house, and had even been locked up one night in it; that he had worked as a painter, and taken frequent opportunities of getting into that house, &c. These circumstances exciting a suspicion that he was the incendiary, he was traced to different places, and at last found in a prison; to which he had been committed for a burglary. On his examination, however, he behaved with such assurance and apparent consciousness of innocence, as almost disconcerted those who were authorised. At last he

Britain. he was deceived into a confession by another painter, who was likewise an American, and pretended to compassionate his case. Thus evidence was procured against him, but he still maintained his character to the very last; rejecting and invalidating the testimony of his false friend, on account of his baseness and treachery. He received his sentence with great fortitude; but at length not only confessed his guilt, but left some directions for preventing the dock-yards and magazines from being exposed to the like danger in time to come.

Thus it appeared that the whole of this alarm of treason and American incendiaries was owing to the political enthusiasm of a wretched vagabond. Still, however, it appeared that the French court were very well acquainted with many particulars relating to the state of this kingdom, and the movements of our squadrons, which ought by all means to have been kept secret. These treacherous proceedings were still detected in the month of June 1780. One Ratcliffe, master of a cutter, gave information that he had been hired by one Mr Rogere to carry packets to France, for which he was to be paid 20l. each time, and to have 100l. besides at a certain period. Apprehending at last, however, that he might incur some danger by continuing this employment, he gave information of what was going on to one Mr Steward, a merchant at Sandwich, by whom his last packet was carried to the secretary of state. After being opened and sealed up again, it was returned, and he was directed to carry it to France as formerly. This was the fate of several succeeding packets, though it was some time before Ratcliffe saw the principal party concerned. At last this was accomplished by his complaining to Mr Rogere that he had not been paid the 100l. according to promise. A meeting being thus procured, it was found that the person who gave intelligence to the enemy was one M. Henry de la Motte, a French gentleman then residing in London. On searching his house, no papers of any consequence were found; but on his arrival, he being absent when the messengers first arrived, he threw some out of his pocket, unperceived by any body, as he thought. The papers, however, were taken up by the messengers, and gave plain indications not only of a treasonable correspondence with the enemy, but that he was connected with one Henry Lutterloh, Esq; a German, who then resided at Wickham near Portsmouth. This person being also apprehended, not only made a full discovery of the treasonable correspondence with France, but gave abundant proofs of himself being one of the most depraved and hardened of all mankind, lost to every sensation excepting the desire of accumulating wealth. His evidence, however, and other strong circumstances, were sufficient to convict M. de la Motte, who was accordingly executed, tho' the king remitted that dreadful part of his sentence of having his heart taken out alive, &c. During his trial, and on every other occasion, he behaved in such a manner as showed him to be an accomplished gentleman; and not only excited the compassion, but the admiration of every one who saw him.

During the whole course of the war, only one other person was detected in any act of treason; and he ap-

pears to have been actuated merely by mercenary motives, though La Motte and John the Painter probably acted from principle. This was one David Tyrie, a native of Edinburgh. Having been bred in the mercantile line, and engaged in a number of speculations with a view to gain money, in all of which he discovered considerable abilities, he at last engaged in the dangerous one of conveying intelligence to the French of the ships of war fitted out in Britain, the time of their sailing, &c. For this he was apprehended in February 1782. The discovery was made by means of one Mrs Askew, who passed for his wife, having delivered a bundle of papers in a hurry to a school-mistress, and desiring her not to show them to any body. Instead of this, however, she not only inspected them herself, but showed them to another, by whom they were sent to the secretary at war. By this, and another packet discovered by William James, who had been employed to carry it to France, Tyrie was convicted and executed in the month of August 1782. He behaved with great resolution, and at last showed rather an indecent levity and unconcern, by laughing at the place of execution. The sentence not only took place in the dreadful manner appointed by law, but the crowd behaved with the most shameful and unexampled barbarity. "Such (say the accounts of his execution) being the singular conduct of many who were near the body, that happy was he who could procure a finger, or some vestige of the criminal!"— This unhappy man, while in prison, had, with his companions, contrived a method of effecting their escape, by working through a brick wall three feet thick, and covering the hole with a plank coloured like the bricks; but the scheme was discovered by the imprudence of Tyrie himself asking the keeper how thick the wall was.

On the whole, it appears, that notwithstanding the excessive altercation and violence of parties, which even went to such a length as to produce duels between some members of parliament, neither the one nor the other entertained any designs against what they believed to be the true interest of the nation. The one seem to have regarded its honour too much, and been inclined to sacrifice even its existence to that favourite notion: the other perhaps regarded the national honour too little; as indeed no advantageous idea could have been formed of the spirit of a nation which could submit to grant its colonies independence without any struggle. The event, however, has shown that the loss of the colonies, so far from being a disadvantage, has been the very reverse. The commerce of Britain, instead of being dependent on America, has arrived at a much greater height than ever, while the consequent increase of wealth may, it is hoped, in time enable the nation to free itself from that enormous debt, great part of which has been contracted, first in defending, and then attempting to conquer the colonies.

New-BRITAIN, a large country of North America, called also *Terra Labrador*, has Hudson's bay and strait, on the north and west; Canada and the river St Lawrence, on the south; and the Atlantic ocean, on the east. It is subject to Great Britain, but yields only skins and furs. The following is the best description of this country that hath yet appeared. It was drawn

Phil. Trans.
Vol. LXXIV.
p. 373.

“ There is no part of the British dominions so little known as the immense country of Labrador. So few have visited the northern parts of this vast country, that almost from the straits of Belleisle until you come to the entrance to Hudson’s bay, for more than ten degrees of latitude, no chart which can give any tolerable idea of the coast hath been hitherto formed. The barrenness of the country explains why it has been so seldom frequented. Here avarice has but little to feed on.

“ Perhaps, without an immoderate share of vanity, I may venture to presume, that, as far as I have been, which is to the latitude of 59. 10. the draught which I have been able to form is by much the best of any that has hitherto been made.

“ Others have gone before me blest with abilities superior to mine, and to whom I hope to be thought equal only in assiduity. But I had advantages of which they were destitute: with a small vessel, and having an Indian with me, who knew every rock and shoal upon the coast, I was enabled to be accurate in my observations; and these are the reasons why I deem my own sketch preferable to all others.

“ As this country is one of the most barren in the whole world, so its sea-coast is the most remarkable. Bordered by innumerable islands, and many of them being a considerable distance from the main land, a ship of burden would fail a great way along the coast without being able to form any notion of its true situation.

“ Hence it is that all charts of it have been so extremely erroneous; and hence arose those opinions that some of the inlets extended a vast distance into the country, if not quite into the sea of Hudson’s bay.

“ Davis’s inlet, which has been so much talked of, is not 20 leagues from the entrance of it to its extremity.

“ The navigation here is extremely hazardous. Towards the land, the sea is covered with large bodies and broken pieces of ice; and the farther you go northward, the greater is the quantity you meet with.

“ Some of these masses, which the seamen call *glants of ice*, are of a prodigious magnitude; and they are generally supposed to swim two thirds under water. You will frequently see them more than 100 feet above the surface; and to ships in a storm, or in thick weather, nothing can be more terrible.

“ These prodigious pieces of ice come from the north, and are supposed to be formed by the freezing of currents upon the lands about East Greenland and the pole. As soon as the severity of the winter begins to abate, their immense weight breaks them from the shore, and they are driven to the southward. To the miserable inhabitants of Labrador their appearance upon the coast serves as a token of the approach of summer.

“ This vast tract of land is extremely barren, and altogether incapable of cultivation. The surface is every where uneven and covered with large stones, some of which are of amazing dimensions. There are few springs; yet throughout the country there are prodigious chains of lakes or ponds, which are produced by

N^o 58.

the rains and the melting of the snow. These ponds abound in trout, but they are very small.

Britain.

“ There is no such thing as level land. It is a country formed of frightful mountains, and unfruitful valleys. The mountains are almost devoid of every sort of herbage. A blighted shrub and a little moss is sometimes to be seen upon them, but in general the bare rock is all you behold. The valleys are full of crooked low trees, such as the different pines, spruce, birch, and a species of cedar. Up some of the deep bays, and not far from the water, it is said, however, there are a few sticks of no inconsiderable size. In a word, the whole country is nothing more than a prodigious heap of barren rocks.

“ The climate is extremely rigorous. There is but little appearance of summer before the middle of July; and in September the approach of winter is very evident. It has been remarked, that the winters within these few years have been less severe than they have been known heretofore. The cause of such an alteration it would be difficult to discover.

“ All along the coast there are many rivers that empty themselves into the sea, yet there are but few of any consideration; and you must not imagine that the largest are any thing like what is generally understood by a river. Custom has taught us to give them this appellation; but the greatest part of them are nothing more than broad brooks or rivulets. As they are only drains from the ponds, in dry weather they are every where fordable; for, running upon a solid rock, they become broad without having a bed of any depth below the surface of the banks.

“ The superficial appearance of this country is extremely unfavourable. What may be hidden in its bowels, we cannot pretend to suggest: probably it may produce some copper; the rocks in many places are impregnated with an ore of that resemblance. Something of a horny substance, which is extremely transparent, and which will scale out into a multitude of small sheets, is often found amidst the stones; there are both black and white of this sort, but the black is the most rare. It has been tried in fire, but seems to be noways affected by heat.

“ The species of wood here are not very various: excepting a few shrubs which have as yet received no name from the Europeans, the principal produce of the country is the different sorts of spruce and pine. Of these, even in the more southern parts, there is not abundance; as you advance northwards they gradually diminish; and by the time you arrive at the 60th degree of latitude, the eye is not delighted with any sort of herbage. Here the wretched residents build their miserable habitations with the bones of whales. If ever they cheer their aching limbs with a fire, they gather a few sticks from the sea shore, which have probably been washed from Norway or Lapland. Here a vast quantity of snow remains upon the land throughout the year.

“ Although the winter here is so excessively rigid, in summer the heat is sometimes disagreeable; and in that season the weather is very moderate, and remarkably serene. It is but seldom foggy, speaking comparatively, between this and Newfoundland; nor are you so frequently liable to those destructive gales of wind which visit many other parts of the globe.

“ It

Britannicus
||
Britton.

“ It is in general high land, and sometimes you meet with mountains of an astonishing height; you are also frequently presented with prospects that are really awful, and extremely romantic.

“ The inhabitants of New Britain are called *Eskimaux*; for a particular account of whom, see the article *ESKIMAUX*.

BRITANNICUS, son to the emperor Claudius by Messalina, was excluded from the empire after his father had married Agrippina; who put her son Nero on the throne, and caused Britannicus to be poisoned, A. D. 55.

BRITANNICUS, an Italian, one of the best humanists of the 15th century, was born at Brescia. He published notes on Persius, Juvenal, Terence, Statius, and Ovid. He died in 1510.

BRITE, or **BRIGHT**, in husbandry. Wheat, barley, or any other grain, is said to *brite*, when it grows over ripe and shatters.

BRITTANY, or **BRETAGNE**, a considerable province of France, which is 150 miles in length, and 112 in breadth. It is a peninsula, surrounded on all sides by the ocean, except on the east where it joins to Anjou, Maine, Normandy, and Poitou. It is divided into the upper and lower; and therein are large forests. It carries on a great trade, by reason of the many harbours on its coasts. It was united to the crown of France in 1532. Rennes is the capital town.

BRITTLENESS, that quality of bodies on account of which they are denominated *brittle*, or which subjects them to be easily broken by pressure or percussion.

Brittle bodies are extremely hard; a very small percussion exerts a force on them equivalent to the greatest pressure, and thus may easily break them. This effect is particularly remarkable in glass suddenly cooled, the brittleness of which is thereby much increased. Tin, though in itself tough, gives a brittleness to all the other metals when mixed therewith. The brittleness of glass has been said to arise from the heterogeneity of the parts whereof it is composed, as salt and sand can never bind sufficiently together: but this cannot be the case; for the pure calces of metals, or any other simple substances when vitrified, become brittle also. In timbers, brittleness seems to be connected with durability; the more brittle any sort of wood is, the more durable it is found. Thus oak is of very long duration; while beech and birch, as being tough, presently rot, and are of little service in building.

BRITTON (Thomas), the famous musical small-coal-man, was born at Higham Ferrers in Northamptonshire. He served his time in London, where he set up in a stable, next door to the little gate of St John of Jerusalem, on Clerkenwell-green, which he converted into a house. Here getting acquainted with Dr Garneiers, his near neighbour, he became an excellent chemist, constructing a moveable laboratory which was much admired by all who saw it. His skill in music was no ways inferior to that in chemistry, either in the theory or practice: he had for many years a well frequented musical club, meeting at his own little cell; and was as well respected as known by persons of the first quality; being, above all, a valuable man in his mo-

ral character. In Ward's account of clubs, we are told, that “ Britton's was first begun, or at least confirmed, by Sir Roger L'Estrange, a very musical gentleman; and that the attachment of Sir Roger and other ingenious gentlemen, lovers of the muses, to Britton, arose from the profound regard he had in general to all manner of literature. It is observable, that this meeting was the first of the kind, and the undoubted parent of some of the most celebrated concerts in London. Ward, who was his cotemporary, says, that at the first institution of it, his concert was performed in his own house, which is thus described. “ On the ground floor was a repository for small-coal: over that was the concert room, which was very long and narrow; and had a ceiling so low, that a tall man could but just stand upright in it. The stairs to this room were on the outside of the house, and could scarce be ascended without crawling. The house itself was very old and low built, and in every respect so mean as to be a fit habitation only for a very poor man.” Notwithstanding all this mansion, despicable as it may seem, attracted to it as polite an audience as ever the opera did. At these concerts Dr Pepusch, Mr Handel, Mr Bauidler, Mr Henry Needler, and other capital masters, were performers. At the first institution of this club, it is certain Britton would receive no gratuity whatever from his guests, and was offended when ever any was offered him. According to some, however, he departed from this; and the rules were, Britton found the instruments, the subscription was 10s. a year, and they had coffee at a penny a dish. The singularity of his character, the course of his studies, and the collections he made, induced suspicious that Britton was not the man he seemed to be. Among other groundless conjectures, his musical assembly was thought by some to be only a cover for seditious meetings; by others, for magical purposes; and Britton himself was taken for an atheist, a presbyterian, a Jesuit, &c. The circumstances of this man's death are not less remarkable than those of his life. There lived at that time one Samuel Honeyman, a blacksmith by trade, who became very famous for a faculty which he possessed of speaking as if his voice proceeded from some distant part of the house where he stood; in short, he was one of those men called *Ventriloquist**, i. e. those that speak from their bellies. One Robe, an acquaintance of Britton's, was foolish enough to introduce this man, unknown to Britton, for the sole purpose of terrifying him; and he succeeded in it. Honeyman, without moving his lips, or seeming to speak, announced, as from afar off, the death of Britton within a few hours, with an intimation that the only way to avert his doom was for him to fall on his knees immediately and say the Lord's prayer: the poor man did as he was bid, went home and took to his bed, and in a few days died, leaving his friend Mr Robe to enjoy the fruits of his mirth. This happened in September 1714. Britton left behind him a large collection of books, music, and musical instruments. Of the former Sir Hans Sloane was a considerable purchaser. His collection of music, mostly picked by himself, and very neatly, sold for near L. 100. In the British Museum there is a painting of him taken from the life. A mezzotinto print was taken from this picture, for which Mr Hughes (author

* See p. 712.

Eliva of the siege of Damascus, and a frequent performer at Britton's concerts) wrote the following lines:

Broach.

Tho' mean thy rank, yet in thy humble cell
Did gentle peace and arts unpurchas'd dwell;
Well pleas'd, Apollo thither led his train,
And music warbled in her sweetest strain.
Cyllenius so, as fables tell, and Jove,
Came willing guests to poor Philemon's grove.
Let us, if pomp behold, and blush to find
So low a station, such a liberal mind.

BRIVA ISARÆ. (anc. geog.), a town of Gallia Belgica on the river Isara or Oise; now *Pontysje*.

BRIVATES, (anc. geog.), a port of Gallia Celtica; now *Brefz*, in Brittany.

BRIVES-LA-GALLARD, a town of France, in lower Limosin. It stands in a fruitful plain, opposite to an island formed by the river Corceze, over which there are two handsome bridges. E. Long. 1. 45. N. Lat. 45. 15.

BRINELLUM, (anc. geog.), a town of Gallia Cispadana; remarkable for being the place where Otho killed himself after the battle of Bedriacum: now *Bersello*, or *Bresello*, in the territory of Rhegio.

BRIXEN (the bishopric of), is seated in Tirol, in Germany, near the frontiers of Friuli and Carinthia, towards the east. The bishop has a vote and seat in the diet of the empire, and furnishes his contingent when any tax is laid on Tirol. The principal places are Brixen, Sertzingen, Breuneck, and Lientz.

BRIXEN, the capital of the bishopric of the same name, and where the bishop commonly resides, is seated on the river Eisache, at some distance from the mountain Brenner. It is surrounded with mountains, where there are plenty of vineyards, which yield good red wine. It is a populous town; and the houses are well built with piazzas, and are painted on the outside. The public buildings are very handsome, and there are several spacious squares. It is much frequented, on account of the mineral waters that are near it. E. Long. 11. 50. N. Lat. 46. 35.

BRIXIA (anc. geog.), a town of the Cenomani in the Regio Transpadana: now *Brescia*, capital of the Bresciano.

BRIZA, QUAKING GRASS, in botany: a genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is two-valved, and multiflorous; the spicula bifarious or spread to the two sides; with the small valves heart-shaped and blunt, and the inner one small in proportion to the rest. There are five species of briza; two of which are natives of Britain, viz. the media or middle quaking-grass, and the minor or small quaking-grass. They grow in pasture grounds.

BRIZE, in husbandry, denotes ground that has lain long untilled.

BRIZE-Vents, shelters used by gardeners who have not walls on the north-side, to keep cold winds from damaging their beds of melons. They are inclosures about six or seven feet high, and an inch or more thick; made of straw, supported by stakes fixed into the ground, and props across on both inside and outside; and fastened together with willow-twigs, or iron-wire.

BROACH, BROCHA (from the French *broche*, de-

notes an awl or bodkin; also a large packing needle. A spit, in some parts of England, is called a *broach*; and from this word comes to pierce or broach a barrel. In Scotland, *broach*, *broche*, or *broche*, is the name of an utensil which the Highlanders use, like the *fibula* of the Romans, to fasten their vest. They are usually made of silver; of a round figure; with a tongue crossing its diameter, to fasten the folds of the garment; sometimes with two tongues, one on each side of a cross-bar in the middle. There are preserved, in several families, ancient broches of very elegant workmanship, and richly ornamented. Some of them are inscribed with names, to which particular virtues used to be attributed; others are furnished with receptacles for relics, supposed to preserve from harm. So that these broches seem to have been worn not only for use but as amulets. One or two of this sort are figured and described by Mr Pennant, *Tour in Scotl.* i. 90. iii. 14. edit. 3d.

BROADCAST, as opposed to the drill husbandry, denotes the method of cultivating corn, turnips, pulses, clover, the foreign grasses, and most other field-plants, that are not transplanted by sowing them with the hand; in which method they are scattered over the ground at large, and thence said to be sown in broadcast. This is called the *old husbandry*, to distinguish it from the drill, horse-hoeing, or new husbandry. See AGRICULTURE

BROAD piece, a denomination given to certain gold-pieces broader than a guinea; particularly Caroluses and Jacobuses.

BROAD-side, in the sea-language, a discharge of all the guns on one side of a ship at the same time. A broad-side is a kind of volley of cannonade, and ought never to be given at a distance from the enemy above musket-shot at point-blank.

BROCADE, or BROCADO, a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the merchants or manufacturers.

Formerly the word signified only a stuff, wove all of gold, both in the warp and in the woof, or all of silver, or of both mixed together; thence it passed to those of stuffs in which there was silk mixed, to raise and terminate the gold or silver flowers: but at present all stuffs, even those of silk alone, whether they be programs of Tours or of Naples, satins, and even taffeties or lustrings, if they be but adorned and worked with some flowers or other figures, are called *brocades*.

In manufacturing brocades, the flattened gilt wire is spun on threads of yellow silk approaching as near as may be to the colour of gold itself. The wire, winding off from a bobbin, twists about the thread as it spins round; and, by means of curious machinery, too complex to be described here, a number of threads are thus twisted at once by the turning of one wheel. The principal art consists in so regulating the motion, that the several circumvolutions of the flattened wire on each side may just touch one another, and form, as it were, one continued covering. It is said, that at Milan there is made a sort of flattened wire gilt only on one side, which is wound upon the thread so that only the gilt side appears; and that the preparation of this wire is kept a secret, and has been attempted in other places with

Broadcast

||
Brocade.

Brocade.

Brocade.

with little success. There is also a gilt copper wire, made in the same manner as the gilt silver: Savary observes, that this kind of wire, called *filfe gell*, is prepared chiefly at Nuremberg; and that the ordinances of France require it to be spun, for its distinction from the gilt silver, on flaxen or hempen threads. One of our writers takes notice, that the Chinese, instead of flattened gilt wire, use slips of gilt paper, which they both interweave in their stuffs and twist upon silk threads: this practice he inconsiderately proposes as a hint to the British weaver. But, whatever be the pretended beauty of stuffs of this kind of manufacture, it is obvious that they must want durability. The Chinese themselves, according to Da Hilde's account, sensible of this imperfection, scarcely use them any otherwise than in tapestries, and such other ornaments as are not intended to be much worn, or exposed to moisture.

Levi's
Commerce
Arts.

The Venetians have carried on a large trade to the Levant, in a kind of brocade called *damaſquets*, which, though it has only about half the quantity of gold or silver as that made among us, looks far more beautiful. The flattened wire is neither wound close together on the silk threads, nor the threads struck close in the weaving; yet, by passing the stuff betwixt rolls, the disposition and management of which is kept a secret, the tissue or flower is made to appear one entire brilliant plate of gold or silver. The French ministry, ever vigilant for the advancement of arts and commerce, judged this manufacture important enough to deserve their attention; and accordingly, for contriving the machinery, they engaged the ingenious M. Vaucanson, known throughout Europe for his curious pieces of mechanism, who, in the memoirs of the academy for the year 1757, lately printed, gives an account of his success, and of the establishment of such a manufacture at Lyons.

The lower roll is made of wood, 32 inches in length and 14 in diameter: the upper one of copper, 36 inches long and 8 in diameter: this last is hollow, and open at one end, for introducing iron heaters. For making the rolls cylindrical, he has a particular kind of lathe, which in the cutting tool, which the most dexterous hand could not guide in a straight line through such a length as 36 inches, is made to slide, by means of a screw, on two large steel rulers, perfectly straight, and capable of being moved at pleasure, nearer, and always exactly parallel, to the axis of the roll.

He first disposed the rolls nearly as in the common flattening mill. In this disposition, ten men were scarcely sufficient for turning them with force enough to duly extend the gilding; and the collars, in which the axes of the rolls turned at each end, wore or galled so fast, that the pressure continually diminished, inasmuch that a piece of stuff of ten ells had the gilding sensibly less extended on the last part than on the first. He endeavoured to obviate this inconvenience by screwing the rolls closer and closer in proportion as the stuff passed thro', or as the wearing of the collars occasioned more play between them; but this method produced an imperfection in the stuff, every turn of the screw making a sensible bar across it. To lessen the attrition, each end of the axis, instead of a collar, was made to turn between three iron cylinders called *friction wheels*: but even this did not answer fully, for now another source of unequal

pressure was discovered. The wooden roll, being compressible, had its diameter sensibly diminished: it likewise lost its roundness, so that the pressure varied in different points of its revolution. On trying different kinds both of European and Indian woods, all the hard ones split, the soft ones warped without splitting, and, of more than 20 rolls, there was not one which continued round for 24 hours even without being worked in the machine.

These failures put him upon contriving another method of pressing the rolls together, so that the force should always accommodate itself to whatever inequalities might happen. The axis of the copper roll being made to turn between friction-wheels as before, that of the wooden one is pressed upwards by a lever at each end furnished with a half collar for receiving the end of the axis. Each lever has the end of its short arm supported on the frame of the machine, and the long arm is drawn upwards by an iron rod communicating with the end of the short arm of another lever placed horizontally: to the long arm of this lever is hung a weight, and the levers are so proportioned, that a weight of 30 pounds presses the rolls together with a force equivalent to 17,536 pounds, which was found to be the proper force for the sufficient extension of the gilding. By this contrivance four men can turn the rolls with more ease than ten can turn those which are kept together by screws; and the same weight acting uniformly in every part, the pressure continues always equal, though the wooden roll should even become oval, and though the stuff be of unequal thickness.

A piece of cloth, of about two ells, is sewed to the beginning and end of the stuff, to keep it out to its width when it enters and parts from the rolls, which could not be done by the hands for fear of burning or bruising them; as it would take too much time to sew these cloths to every small piece of an ell or two, a number of these is sewed together. The stuff is rolled upon a cylinder, which is placed behind the machine, and its axis pressed down by springs to keep the stuff tight as it comes off. Four iron bars, made red hot, are introduced into the copper roll, which in half an hour acquires the proper degree of heat, or nearly such a one as is used for the ironing of linen: the wooden roll is then laid in its place, and the machine set to work. If more than 30 ells are to be passed at once, the wooden roll must be changed for another, for it will not bear a long continuance of the heat without danger of splitting; and therefore the manufacturer should be provided with several of these rolls, that when one is removed, another may be ready to supply its room: as soon as taken off from the machine, it should be wrapt in a cloth and laid in a moist place.

The principal inconvenience attending the use of this machine, is, that the heat necessary for extending the gilding, though it improves the brightness of white and yellow silks, is injurious to some colours, as crimson and green. A double pressure will not supply the place of heat; and the only method of preventing this injury, or rendering it as slight as possible, appeared to be, to pass the stuff through with great celerity.

Method of Cleaning Brocade when Gilded. For this purpose neither alkalis nor soap must be used; because the former, which they clean the gold, corrode the silk.

Brocadel
||
Brogling

and change or discharge its colour; and the latter also alters the shade, and even the species, of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual for restoring the lustre of the gold, as the most corrosive detergents. A rich brocade, flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipped in warm spirit of wine, and some of the colours of the silk which were likewise soiled became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the boasted secret of certain artists is no other than this spirit disguised. Dr Lewis says he does not know of any other that is of sufficient activity to discharge the foul matter, without being hurtful to the silk. As to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial, and of extreme tenuity.

Commerce of
Ants, p. 39.

BROCADE Shell, the English name of a species of **LINAX**.

BROCADEL, or **BROCADEL**, a kind of coarse brocade; chiefly used for tapestry.

BROCCOLI, a kind of cabbage cultivated for the use of the table. See **BRASSICA**.

BROCHE, or **BROACH**. See **BROACH**.

BROCK, among sportsmen, a term used to denote a badger.—A hart, too, of the third year, is called a *brock*, or *brocket*; and a hind of the same year is called a *brocket's sister*.

BROD, a town of Hungary, in the county of Pofsega in Slavonia, seated on the river Save. It was once more considerable than at present; and is memorable for a victory obtained over the Turks in 1668. E. Long. 18. 36. N. Lat. 45. 20.

BRODEAU (John), in Latin *Brodeus*, a great critic, on whom Lysius, Scaliger, Grotius, and all the learned, have bestowed great encomiums, was descended from a noble family in France, and born at Tours in 1500. He was liberally educated, and placed under Alciat to study the civil law; but soon forsaking that, he gave himself up wholly to languages and the belles lettres. He travelled into Italy, where he became acquainted with Sadolet, Bembo, and other famous wits; and here (says Thaumus) he applied himself to the study of mathematics, philosophy, and the sacred languages, in which he made no small proficiency. Then, returning to his own country, he led a retired, but not an idle, life, as his many learned lucubrations abundantly testify. He was a man free from all ambition and vain glory, and suffered his works to be published rather under the sanction and authority of others than under his own. His chief works are, 1. A commentary on the *Arithmetica*. 2. Ten books of miscellanies. 3. Notes on Oppian, Euripides, &c. He died in 1553, aged 63.

BRODERA, or **BRODRA**, a town of Asia, in the empire of the Great Mogul. It stands in a large sandy plain, on the little river Wasset; and is fortified, after the old way, with pretty good walls and towers. It is inhabited by Banians and callico-weavers. The country about it produces plenty of gum lac and indigo. E. Long. 72. 30. N. Lat. 22. 10.

BROGLING FOR BELS; the same with **SNIGGLING**.

Broglio
||
Broker.

BROGLIO, a town of Piedmont in Italy, and capital of a county of the same name, situated near the frontiers of Provence, in E. Long. 6. 42. N. Lat. 44. 12.

BROKE (Sir Robert), lord chief justice of the common pleas, was the son of Thomas Broke, Esq; of Claverly in Shropshire, and educated at Oxford; from whence he removed to the Middle Temple, and soon became a very eminent lawyer. In the year 1542, he was chosen summer reader, and double reader in 1550. In 1552, he was made serjeant at law; and the year following (first of queen Mary), lord chief justice of the common pleas; about which time he received the honour of knighthood. Stow says he was recorder of London and speaker of the house of commons; which is confirmed by a manuscript in the Ashmolean library. He died and was buried at Claverly in Shropshire, the place of his nativity, in 1558. Wood gives him the character of a great lawyer and an upright judge. His works are, 1. An abridgement containing an abstract of the year-books till the time of queen Mary. 2. Certain cases adjudged in the reign of Henry VIII. Edward VI. and queen Mary. 3. Reading on the statute of limitations, 32 Hen. VIII. c. 2.

BROKEN WIND, among farriers. See **FARRIERY**.

BROKER. The origin of the word is contested; some derive it from the French *broier*, "to grind;" others from *brocarder*, "to cavil, or triggler;" others deduce broker from a trader broken, and that from the Saxon *broc* "misfortune," which is often the true reason of a man's breaking. In which view, a broker is a broken trader by misfortune; and it is said none but such were formerly admitted to that employment.

BROKERS are of three kinds; exchange-brokers, stock-brokers, and pawn-brokers.

Exchange BROKERS, are a sort of negociators, who contrive, make, and conclude bargains between merchants and tradesmen, in matters of money or merchandise, for which they have a fee or premium. These, in old English law-books, are called *broggers*, and in Scotland, *broccarii*, i. e. according to Skene, mediators or intercessors in any contract, &c.

They make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to notify to those who have money to receive or pay beyond sea, who are proper persons for negotiating the exchange with; and when the matter is accomplished, that is, when the money is paid, they have for brokage 2s. per 100 l. sterling. These, by the statute of 8 and 9 William III. are to be licensed in London by the lord mayor, who gives them an oath, and takes bond for the faithful execution of their offices. If any person shall act as broker without being thus licensed and admitted, he shall forfeit the sum of 500 l.; and persons employing him, 5 l.; and brokers are to register contracts, &c. under the like penalty: also brokers shall not deal for themselves, on pain of forfeiting 200 l. They are to carry about with them a silver medal, having the king's arms and the arms of the city, and pay 40s. a-year to the chamber of the city.

In France, till the middle of the 17th century, their exchange-brokers were called *courtiers de change*; but by an arret of council in 1639, the name was changed for that more creditable one of *agent de change, banquier*,

Broker. *Et finant;* and in the beginning of the 18th century, to render the office still more honourable, the title of *king's counsellors* was added.

At Grand Cairo, and several places of the Levant, the Arabs, who do the office of exchange-brokers, are called *cosuls*; the manner of whose negotiating with the European merchants has something in it so very particular, that we have referred it to a distinct article. See *CONSUL*.

The exchange-brokers at Amsterdam, called *makel-ders*, are of two kinds; the one, like the English, called *sworn brokers*, because of the oath they take before the burgo-masters; but the others negotiate without any commission, and are called *walking brokers*. The first are in number 395; whereof 375 are Christians, and 20 Jews: the others are near double that number; so that in Amsterdam there are near 1000 exchange-brokers.—The difference between the two consists in this: The books and persons of the former are allowed as evidence in the courts of justice; whereas, in case of dispute, the latter are disowned, and their bargains disannulled.

The fee of the sworn exchange-brokers of Amsterdam is fixed by two regulations, of 1613 and 1623, with regard to matters of exchange, to 18 sols for 100 livres de gros, or 600 florins; i. e. three sols for 100 florins; payable, half by the drawer and half by the person who pays the money. But custom has made considerable alterations herein.

The Jews, Armenians, and Banians, are the chief brokers throughout most parts of the Levant and the Indies. In Persia, all affairs are transacted by a sort of brokers whom they call *delal*, i. e. great takers. The manner of making their markets is very singular: after the brokers have launched out into long, and usually impertinent discourses, coming towards a conclusion, they only converse with their fingers. The buyer and seller's broker each take the other by the right hand, which they cover with their coat, or a handkerchief: the finger stretched out stands for six; bent for five; the tip of the finger for one; the whole hand for 100; and the hand clenched, for 1000. They will express even pounds, shillings, and pence, by their hands. During all this mystic commerce, the two brokers appear as cold and composed as if there were nothing passing between them.

The French distinguish two kinds of brokers; one for the service of merchants, the other of manufacturers, artificers, and workmen. The business of the former is to facilitate the sale of goods in the wholesale and mercantile way; that of the other, to procure the goods wanted for manufacturers, artificers, &c. or to sell their goods when made. At Paris there is scarce a company of tradesmen, or even mechanics, but have their brokers, who are usually taken out of their body, and make it their sole business to negotiate in the particular kinds of goods to which such company is by statutes restrained. There are brokers for drapery, brokers for grocery, brokers for mercery, &c. There are even brokers for tanners, curriers, cutlers, and the like.

Stock Brokers, are those who are employed to buy and sell shares in the joint stock of a company or corporation, and also in the public funds. As the practice of stock-jobbing has been carried to such an ex-

cess as became not only ruinous to a great number of private families, but even affected, or at least might soon affect, the public credit of the nation, the legislature thought fit to put a stop to it, or at least to bring it within certain bounds, and under some regulation. The negotiations, &c. of these brokers are regulated by stat. 6 Geo. I. cap. 18. and 7 and 10 Geo. II. cap. 8. which, among other things, enact, that contracts in the nature of wagers, &c. incur a penalty of L. 500, and by the sale of stock, of which the feller is not possessed, a forfeit of L. 100, and that brokers keep a book, in which all contracts, with their dates, and the names of the parties concerned, shall be entered, on pain of L. 50.

Pawn-Brokers, persons who keep shops, and lend money upon pledges to necessitous persons, and most commonly at an exorbitant interest. They are more properly styled *pawn-takers*, or *tally-men*; sometimes *juipers*, or *striperers*. These are meant in 1 Jac. I. cap. xxi. sect. 5. where it is declared, that the sale of goods wrongfully taken to any broker, or pawn-broker, in London, Westminster, Southwark, or within two miles of London, does not alter the property. And (sect. 7.) if a broker, having received such goods, shall not, upon request of the owner, discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof, to be recovered by action of debt, &c.

In the cities of Italy, there are companies established by authority for the letting out money on pawns, called *mounts of piety*; a title little becoming such institutions. In some parts of Italy, they have also mounts of piety of another kind, wherein they only receive ready money, and return it again with interest, at a certain sum *per annum*. At Bologna, they have several such mounts, which are distinguished into *frank* and *perpetual*: the interest of the former is only four *per cent.*; that of the latter, seven.

BROKERS are also those who sell old household furniture, and wearing apparel, &c.

BROME (Alexander), a poet and attorney in the lord mayor's court in the reign of Charles II. was the author of the greatest part of those songs and epigrams which were published in favour of the royalists, and against the *rump*, as well in Oliver Cromwell's time as during the rebellion. These, together with his Epistles and Epigrams translated from different authors, were all printed in one volume 8vo after the Restoration. He also published a version of Horace, by himself and others, which is very far from being a bad one. He left behind him a comedy entitled *The Cunning Lovers*: and the world is indebted to him for two volumes of Richard Biome's plays in octavo; many of which, but for his care in preserving and publishing them, would in all probability have been entirely lost. He died in 1696.

BROME (Richard), a dramatic writer who lived in the reign of king Charles I. and was cotemporary with Decker, Ford, Shirley, &c. His extraction was mean, he having been originally no better than a menial servant to the celebrated Ben Johnson. He wrote himself, however, into high reputation, as is testified not only by various commendatory verses written by his cotemporaries and prefixed to many of his plays, but also by some lines which his quondam master addressed to him

Broker,
Biome.

Bromelia.

on account of his comedy called *The Northern Lays*. Brome, in imitation of his master, laid it down as his first great point, to apply closely to the study of men and manners. His genius was entirely turned to comedy; and therefore his proper province was observation more than reading. His plots are all his own, and are far from being ill conducted; and his characters, which for the most part are strongly marked, were the offspring of his own judgment and experience, and his close attention to the foibles of the human heart. In a word, his plays in general are good ones; met with great applause when first acted; and as Langbain informs us, were thought by the players worthy to be revived, to their own profit and the author's honour, in that critical age which he himself lived in. Nay, we have had a proof, even in our own time, of the merit of one of his comedies, which with a very little alteration has lately been revived, and with great success, viz. *The Jovial Crew*, which for no less than three seasons running brought crowded audiences to the theatre-royal in Covent Garden at all the frequent repetitions of its performance. The comedies which the author left behind him are 15 in number; ten of which are collected together, as above mentioned, in two volumes octavo. He joined also with Thomas Heywood in a play called *The Lancashire Witches*.

BROMELIA, the **PINE-APPLE**: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 10th order, *Coronarie*.

Species. Of this genus Linnæus enumerates seven species; but the following are the most remarkable. I. The ananas, of which there are six varieties, viz. 1. The ovatus, or oval shaped pine-apple. 2. The pyramidalis, pyramidal, or sugar-loaf pine. 3. The glaber, with smooth leaves. 4. The lucidus, with shining green leaves. 5. The ferrotinus, with a yellowish coloured flesh. 6. The viridis, or green pine-apple. The other species are, II. The nudicaulis, with the lower leaves indented and prickly. III. The lingulata, with obtuse, sawed, and prickly leaves.—The first sort hath leaves very like some sorts of aloe, but not so thick and succulent, which are strongly armed with black spines. From the centre of the plant arises the flower-stalk, which is near three feet high, the lower part of which is garnished with entire leaves placed alternately at every joint. The upper part of the stalk is garnished with flowers set in a loose spike or thyrse quite round: these are succeeded by oval seed-vessels, having a longitudinal partition, in the centre of which are fastened smooth cylindrical seeds.—The second hath shorter leaves than the first, which are sharply sawed on their edges, and of a deep green colour. The flower-stem arises from the centre of the plant, which divides upward into several branches: the upper part of these are garnished with spikes of flowers, which come out alternately from the sides of the branches, each having a narrow entire leaf just below it, which are longer than the spike. The flowers are placed very close on the spikes; and when they decay, the empalement turns to an oval pointed seed-vessel, inclosing seeds of the same shape with the other.

Culture, &c. The first sort of ananas is the most common in Europe; but the second sort is much pre-

erable to it, the fruit of this being larger and much better flavoured: the juice of this sort is not so astringent as that of the first; so that this fruit may be eaten in greater quantity with less danger. This sort frequently produces suckers immediately under the fruit, whereby it may be increased much faster than the common sort; so that in a few years it may be the best common sort in Britain.—The third sort is preserved by some curious persons for the sake of variety; but the fruit is not worth any thing.—The sort with very smooth grass-green leaves was raised from seeds taken out of a rotten fruit which came from the West Indies to the late Henry Heathcote, Esq; from whom Mr Miller received one plant, which produced large fruit: this is what the people of America call the *king pine*.—The plants are propagated by planting the crowns which grow on the fruit, or the suckers which are produced either from the sides of the plants or under the fruit: both which are found to be equally good; although by some persons the crown is thought preferable to the suckers, as supposing it will produce fruit sooner than the suckers, which is certainly a mistake. The suckers and crowns must be laid to dry in a warm place for four or five days, or more (according to the moisture of the part which adhered to the old plant or fruit); for if they are immediately planted, they will rot. The certain rule of judging when they are fit to plant, is by observing if the bottom is healed over and become hard; for if the suckers are drawn off carefully from the old plants, they will have a hard skin over the lower part, so need not lie so long as the crowns of those whose bottoms are moist. But whenever a crown is taken from the fruit, or the suckers from old plants, they should be immediately divested of their bottom-leaves, so high as to allow depth for their planting; so that they may be thoroughly dry and healed in every part, lest when they receive heat and moisture they should perish, which often happens when this method is not observed. If these suckers or crowns are taken off late in the autumn, or during the winter, or early in the spring, they should be laid in a dry place in the stove for a fortnight or three weeks before they are planted; but in the summer season, they will be fit for planting in a week at furthest.

These should be planted in a rich good kitchen-garden mould, not too heavy so as to detain the moisture too long, nor over light and sandy; but where this is wanting, you should procure some fresh earth from a good pasture, which should be mixed with about a third part of rotten neats dung, or the dung of an old melon or cucumber bed which is well consumed. These should be mixed six or eight months before they are used, but if it be a year it will be the better; and should be often turned, that their parts may be the better united, as also the clods well broken. This earth should not be screened very fine; for if you only clear it of the great stones, it will be better for the plants than when it is made too fine. You should always avoid mixing any sand with the earth, unless it be extremely stiff, and then it will be necessary to have it mixed at least six months or a year before it is used; and it must be frequently turned, that the sand may be incorporated in the earth so as to divide its parts; but you should not put more than a sixth part

Bromelia.

of sand; for too much sand is very injurious to these plants. In the summer season, these plants must be frequently watered; but you should not give them large quantities at a time: you must also be very careful that the moisture is not detained in the pots by the holes being stopped, for that will soon destroy the plants. If the season is warm, they should be watered twice a-week; but in a cool season, once a-week will be often enough: and, during the summer season, you should once a-week water them gently all over their leaves; which will wash the filth from off them, and thereby greatly promote the growth of the plants.

There are some persons who frequently shift these plants from pot to pot. But this is by no means to be practised by those who propose to have large well-flavoured fruit: for, unless the pots be filled with the roots, by the time the plants begin to show their fruit, they commonly produce small fruit, which have generally large crowns on them; therefore the plants will not require to be new potted oftener than twice in a season. The first time should be about the end of April, when the suckers and crowns of the former year's fruit (which remained all the winter in those pots in which they were first planted) should be shifted into larger pots; *i. e.* those which were in halfpenny or three-farthing pots should be put into penny or at most three-halfpenny pots, according to the size of the plants; for you must be very careful not to overpot them, nothing being more prejudicial to these plants. The second time for shifting of them is in the beginning of August; when you should shift those which are of a proper size for fruiting the following spring into two-penny pots, which are full large enough for any of these plants. At each of these times of shifting the plants, the bark-bed should be stirred up, and some new bark added, to raise the bed up to the height it was at first made; and when the pots are plunged again into the bark-bed, the plants should be watered gently all over their leaves, to wash off the filth, and to settle the earth to the roots of the plants. If the bark-bed be well stirred, and a quantity of good fresh bark added to the bed, at this latter shifting, it will be of great service to the plants; for they may remain in the same tan until the beginning of November, or sometimes later, according to the mildness of the season, and will require but little fire before that time. During the winter, they will not require to be watered oftener than once a-week, according as you find the earth in the pots to dry: nor should you give them too much at each time; for it is much better to give them a little water often, than to over-water them.

You must observe never to shift those plants which show their fruit into other pots; for if they are removed after the fruit appears, it will stop the growth, and thereby cause the fruit to be smaller, and retard its ripening, so that many times it will be October or November before the fruit is ripe: therefore you should be very careful to keep the plants in a vigorous growing state from the first appearance of the fruit, because upon this depends the goodness and the size of the fruit; for if they receive a check after this, the fruit is generally small and ill-tasted.—When you have cut off the fruit from the plant whose kind you are desirous to propagate, you should trim the leaves, and

plunge the pots again into a moderate hot-bed, observing to refresh them frequently with water, which will cause them to put out suckers in plenty; so that a person may be soon supplied with plants enough of any of the kinds, who will but observe to keep the plants in health.

The most dangerous thing that can happen to these plants is their being attacked by small white insects, which appear at first like a white mildew, but soon after have the appearance of lice: these attack both root and leaves at the same time; and, if they are not soon destroyed, will spread over a whole stove in a short time, and in a few weeks entirely stop the growth of the plants by sucking out the nutritious juice, so that the leaves will appear yellow and sickly, and have generally a great number of yellow transparent spots all over them. These insects, after they are fully grown, appear like bugs, adhering so closely to the leaves as not to be easily washed off, and seem to have no local motion. They were originally brought from America upon the plants which were imported from thence; and are probably the same insects which have destroyed the sugar-canes of late in some of the Leeward Islands, for upon some sugar-canes which were sent Mr Miller from Barbadoes he observed great numbers of these insects. Since they have been in England, they have spread greatly in such stoves where there has not been more than ordinary care taken to destroy them. They have also attacked the orange-trees in many gardens near London, and have done them incredible damage; but they do not endure the cold of our climate in winter, so that they are never found on such plants as live in the open air. The only method yet discovered for destroying these insects, is by frequently washing the leaves, branches, and stems, of such plants as they attack, with water in which there has been a strong infusion of tobacco stalks. But this method cannot be practised on the ananas plants, because the insects will fasten themselves so low between the leaves, that it is impossible to come at them with a sponge to wash them off; so that if all those which appear to sight are cleared off, they will soon be succeeded by a fresh supply from below, and the roots will be also equally infested at the same time. Therefore, wherever these insects appear on the plants, the best method will be to take the plants out of the pots, and clear the earth from the roots; then prepare a large tub, which should be filled with water in which there has been a strong infusion of tobacco stalks; into this tub you should put the plants, placing some sticks cross the tub to keep them immersed in water. In this water they should remain 24 hours; then take them out, and with a sponge wash off all the insects from the leaves and roots, and dip the plants into a tub of fair water, washing them therein, which is the most effectual way to clear them from the insects. After which, you should pot them in fresh earth; and, having stirred up the bark-bed, and added some new tan to give a fresh heat to the bed, the pots should be plunged again, observing to water them all over the leaves, and this should be repeated once a-week during the summer season; for these insects always multiply much faster where the plants are kept dry, than where they are sometimes sprinkled over with water, and kept in a growing state. As these insects are frequently brought

Bromelia?

Bromelia. over from America on the ananas plants which come from thence, those persons who procure their plants from thence, should look carefully over them when they receive them, to see they have none of these insects on them; for if they have, they will soon be propagated over all the plants in the stove where they are placed: therefore, whenever they are observed, the plants should be soaked (as before directed) before they are planted into pots.

Such are the directions generally given with regard to the culture of the pine-apple in this country. Of late, however, some very considerable improvements have been made in that article. The leaves of the oak have been substituted to the more expensive bark; and by treating the pines with them, they are found to thrive as well, and to produce as good fruit, as in the other method: of the proper way of managing these leaves for the rearing of exotic plants, an account is given under the article *OAK-LEAVES*. But the most considerable improvement is that mentioned in the 67th volume of the Philosophical Transactions, where a method is shown by William Bastard, Esq; of Devonshire, of raising these fruits in water. His account of this method is as follows.

“ Before I enter into the particulars of raising pine-apples in water, it will be necessary to tell you that my hot-house is covered with the best crown-glass, which I apprehend gives more heat than the common sort of green glass generally used for hot-houses. In the front part of the house, and indeed any where in the lowest parts of it, the pine-apple plants will not thrive well in water. The way in which I treat them is as follows. I place a shelf near the highest part of the back wall, so that the pine-plants may stand without absolutely touching the glass, but as near it as can be: on this shelf I place pans full of water, about seven or eight inches deep; and in these pans I put the pine-apple plants, growing in the same pots of earth as they are generally planted in to be plunged into the bark-bed in the common way; that is, I put the pot of earth, with the pine-plant in it, in the pan-full of water, and as the water decreases I constantly fill up the pan. I place either plants in fruit, or young plants as soon as they are well rooted, in these pans of water, and find they thrive equally well: the fruit reared this way is always much larger, as well as better flavoured, than when ripened in the bark-bed. I have more than once put only the plants themselves without any earth, I mean after they had roots, into these pans of water, with only water sufficient to keep the roots always covered, and found them flourish beyond expectation. In my house, the shelf I mention is supported by irons from the top, and there is an intervening space of about 10 inches between the back wall and the shelf. A neighbour of mine has placed a leaden cistern upon the top of the back flue (in which, as it is in contact with the flue, the water is always warm when there is fire in the house), and finds his fruit excellent and large. My shelf does not touch the back flue, but is about a foot above it; and consequently the water is only warmed by the air in the house. Both these methods do well. The way I account for this success is, that the warm air always ascending to the part where this shelf is placed, as being the highest part of the house, keeps it much hot-

ter than in any other part. The temperature at that place is, I believe, seldom less than what is indicated by the 73d degree of Fahrenheit's thermometer, and when the sun shines it is often at above 100: the water the plants grow in seems to enable them to bear the greatest heat, if sufficient air be allowed; and I often see the roots of the plants growing out of the holes in the bottom of the pot of earth, and shooting vigorously in the water.

“ My hot-house (the dimensions of which it may be proper to know) is 60 feet long and 11 feet wide, the flues included; six feet high in the front, and 11 feet at the back of the inside of the house. It is warmed by two fires. A leaden trough or cistern on the top of the back flue is preferable to my shelf, as in it the pine-plants grow much failer in the winter, the water being always warmed by the flue: of this I have seen the great benefit these last two months in my neighbourhood. It is not foreign to this purpose to mention, that, as a person was moving a large pine-plant from the hot-bed in my house last summer, which plant was just showing fruit, by some accident he broke off the plant just above the earth in which it grew, and there was no root whatever left to it: by way of experiment I took the plant, and fixed it upright in a pan of water (without any earth whatever) on the shelf; it there soon threw out roots, and bore a pine-apple that weighed upwards of two pounds.”

BROMLEY, a town of Kent in England, situated on the river Ravensburn, in E. Long. 0. 5. N. Lat. 51. 23.

BROMSGROVE, a town of Worcestershire in England, seated on the river Salwarp. It is a pretty good town, well inhabited by clothiers; and the market is large for corn, cattle, and all sorts of provisions. W. Long. 2. 5. N. Lat. 52. 26.

BROMUS, *BROOM GRASS*, in botany: A genus of the digynia order, belonging to the triandria class of plants; ranking, in the natural method, under the 4th order, *Gramina*. The calyx is bivalved, having a partial spike, oblong and round, opposite grains, with an awn below the point of each outer valve. There are 24 species, eight of which are natives of Britain, viz. the fecalinus or field broom-grass; the arvensis, or common broom-grass; the ciliatus, or wall broom-grass; the sterilis, or barren broom-grass; the giganteus, or tall broom-grass; the ramosus, or wood broom-grass; and the pinatus, or spiked broom-grass.

BROMYARD, a town of Herefordshire in England, seated on a rising ground, and containing about 200 houses. W. Long. 2. 46. N. Lat. 52. 20.

BRON, a town of Italy, in the duchy of Milan, where the Imperialists gained an advantage over the French in 1703. E. Long. 10. 0. N. Lat. 44. 50.

BRONCHIA, in anatomy, the ramifications of the trachea. See *ANATOMY*, n^o 116.

BRONCHOCELE, a tumor rising in the anterior part of the neck. See *MEDICINE-INDEX*.

BRONCHOTOMY, in surgery, an incision made in the *arteria*, or wind-pipe, which is necessary in many cases, and especially in a violent quinsy, to prevent suffocation from the great inflammation or tumor of the parts. It is also called *laryngotomy* and *tracheotomy*. See *SURGERY*.

Bronkhorst
||
Brooze.Bronze
||
Brooke.

BRONKHORST (John Van), an eminent painter who flourished about the middle of the last century. He was born at Utrecht; and after having studied under several masters, entered the school of Cornelius Poelemburg, whose style of painting he imitated with great success. He painted both history and landscapes; and his pictures, which are very highly finished, are held in great estimation. He amused himself with the point; and some landscapes from Poelemburg, together with other subjects from his own compositions, are attributed to him.

BRONTÆ, or **THUNDER-STONES**, in natural history. See **BELEMNITES**.

BRONTIUM, in Grecian antiquity, a place underneath the floor of the theatres, in which were kept brazen vessels full of stones and other materials, with which they imitated the noise of thunder.

BRONTOLOGY, denotes the doctrine of thunder, or an explanation of its causes, phenomena, &c. together with the prefaces drawn from it. See **ELECTRICITY** and **THUNDER**.

BRONZE, a compound of copper and tin, to which sometimes other metallic substances, particularly zinc, are added.—This metal is brittle, hard, and sonorous. It is employed for various uses, as for making of bells, cannons and statues; and the proportions of the component metals are varied to suit the several purposes to which it is applied. This compound, like some others, is specifically heavier than either of the metals taken separately. A metallic mass, composed of four fifths of copper and one-fifth part of tin, weighs in water $7\frac{1}{10}$ grains more than the same quantities of these two metals would together weigh in water if not alloyed. This proves, that in the union of copper and tin there is a penetration of parts, the one metal entering into the pores of the other; and this is further confirmed by an observation of Mr Tillet, member of the royal academy of sciences. In his memoir concerning the ductility of metals, he takes notice, that when the mixture of copper and tin is made in the proportions above-mentioned, the colour of the copper is entirely annulled and covered by that of the tin, although the quantity of the first be four times greater; and this singular effect cannot be understood without admitting a total change in the size and disposition of the pores of the compound metal.

Tin being less subject to rust than copper, bronze is also found to be less liable to be covered with verdigrise than pure copper is; and this is one reason why it is used for cannons, statues, and works exposed to the air and weather. The greater fusibility of bronze than copper is also an advantageous property, and much facilitates the casting of large works. The operation for casting bronze is sufficiently simple. For this purpose a brick furnace is used, nearly of the shape of an oven for baking bread. The floor of this furnace is concave, and consists of a composition of sand and clay. In this hollow floor the metals to be fused are put.—The furnace has three openings. The first is a lateral mouth, at which enters the flame of the wood placed in a second furnace, on one side of the first: the second opening is a chimney placed on a side opposite to the mouth, by means of which the flame is drawn over the metal. The third is a hole which is opened and shut at

pleasure; through which the inner part of the furnace may be occasionally inspected, that the state of the metal may be observed. When the metal is in the state required, a fourth opening is then unclosed, communicating with the hollow floor, and thro' which the melted metal flows by channels into the moulds prepared to receive it.

BRONZE, also denotes a colour prepared by the colourmen of Paris, wherewith to imitate bronze.—There are two sorts, the red bronze, and the yellow or golden. The latter is made solely of copper-dust, the finest and brightest that can be got: the former is made of the same, with the addition of a little quantity of red ochre well pulverized. They are both applied with varnish. To prevent their turning greenish, the work must be dried over a chaling-dish as soon as bronzed.

BRONZES, a name given by antiquarians to figures either of men or beasts, to urns, and in general to every piece of sculpture which the ancients made of that metal. We likewise give the name of *bronzes* to statues or busts cast of bronze, whether these pieces be copies of antiques or original subjects.—Among medallists, all copper medals bear the name of *bronze*.

BRONZING, the art or act of imitating bronze, which is done by means of copper-dust or leaf, fastened on the outside, as gold leaves are in gilding.

BROOD, the young of fish, fowls, &c.

BROODING, the act of a hen in hatching her eggs. See **HATCHING**.

BROOK, a little river or small current of water.—A brook is distinguished from a river, inasmuch as a river flows at all times, whereas a brook flows at some particular seasons only.

Brook-Lime. See **VERONICA**.

BROOKE (Mrs), daughter of a clergyman of the name of Moore, was a lady as remarkable for her virtues and suavity of manners as for her great literary accomplishments. Her first performance, which introduced her to the notice and consequent esteem of the public, was *Julia Marcella*; a work concerning which there were various opinions, but which every body read with eagerness. It has been often wished that she had made the catastrophe less melancholy; and we believe that she afterwards was of the same opinion, but she thought it beneath her character to alter it. She soon afterwards went to Canada with her husband, who was chaplain to the garrison at Quebec; and here she saw and loved those romantic characters and scenes which gave birth to *Emily Montague*, a work most deservedly in universal esteem, which has passed through several editions, and which is now not easily met with. On her return to England, accident introduced her, and congenial sentiments attracted her, to Mrs Yates; an intimacy was formed, which terminated only with the life of that lady. Mrs Brooke, in consequence of this connection, formed an acquaintance with Mr Garrick, and wrote some pieces for the stage. She had, however, great reason to be dissatisfied with his behaviour as a manager; and she made *The Excursion*, a novel which she wrote at this time, the vehicle by which she exhibited to the public her complaints and anger against the king of Drury. Her anger, we believe, was just, but the retribution was too severe. She herself af-

Broom
||
Broome.

terwards thought so, for she lamented and retracted it. Her first dramatic performance was the tragedy of *Virginia*, 1756. Her next effort in that line was, *The Siege of Synope*, a tragedy introduced by Mr Harris, and written principally with a view of placing Mrs Yates in a conspicuous character. This did not altogether fail, but it did not become popular; it wanted energy, and it had not much originality; there was little to disapprove, but there was nothing to admire. Her next and most popular production was *Resina*, which, in a most liberal manner, she presented to Mr Harris. Few modern pieces have been equally successful. Last year also, a musical piece of hers, entitled *Marian*, was introduced, which is now occasionally exhibited, for which we believe Shield is principally to be thanked. Mrs Brooke was also the translator of various books from the French. She was esteemed by Dr Johnson, valued by Miss Seward, and her company courted by all the first characters of her time. She died in January 1789, two days after her husband. Her husband enjoyed the rectory of Colney in Norfolk, to which he had been preferred after his arrival from America.

BROOM, in botany. See GENISTA.

Butcher's Broom, in botany. See RUSCUS.

Spanish Broom, in botany. See SPARTIUM.

BROOM also denotes a well-known household becom or implement wherewith to sweep away dirt, dust, and the like. We say, a *birch-broom*, a *hair-broom*, a *rush-broom*, a *heath-broom*. The primitive kind of brooms, from whence the denomination is given to all the rest, was made of the genista or wild broom growing on commons.

Broom-flower gives the denomination to an order of knights instituted by St Lewis of France, on occasion of his marriage. The motto was, *Exaltat humiles*, and the collar of the order made up of broom-flowers and husks, enamelled and intermixed with *flour-de-lys* of gold, set in open lozenges, enamelled white, chained together, and as it hung a cross florence of gold. This answers to what the French call *Ordre de la Geneste*, from the name of a species of broom so called; different from the common broom, as being lower, the stalk smaller, and leaf narrow; the flower is yellow, and bears a long husk. Some also speak of another order of the *Geneste* or *Broom* established by Charles Martel, or rather Charles VI.

Broom-gall, in natural history, a name given by authors to a remarkable species of galls found on the *genista vulgaris* or common broom. This is occasioned, like all other galls, by the puncture and eating of an insect; and, when opened, is found to contain a small oblong worm, of a red colour, but whose size requires the use of a glass in order to see it distinctly.

Broom-Rape, in botany. See OROBANCHE.

BROOME (William), the coadjutor of Pope in translating the *Odyssey*, was born in Cheshire, as is said, of very mean parents. He was educated upon the foundation at Eaton, and was captain of the school a whole year, without any vacancy, by which he might have obtained a scholarship at King's college. Being by this delay, such as is said to have happened very rarely, superannuated, he was sent to St John's college by the contribution of his friends, where he ob-

tained a small exhibition. At this college he lived for some time in the fane chamber with the well-known Ford, by whom Dr Johnson heard him described as a contracted scholar and a mere versifier, unacquainted with life, and unskilful in conversation. His addiction to metre was then such, that his companions familiarly called him *Poet*. When he had opportunities of mingling with mankind, he cleared himself, as Ford likewise owned, from great part of his scholastic rust. He appeared early in the world as a translator of the *Iliads* into prose, in conjunction with Ozell and Oldisworth. How their several parts were distributed is not known. This is the translation of which Ozell boasted as superior, in Toland's opinion, to that of Pope: It has long since vanished (Dr Johnson observes), and is now in danger from the critics. He was introduced to Mr Pope, who was then visiting Sir John Cotton at Madingley, near Cambridge; and gained so much of his esteem, that he was employed to make extracts from Eustathius for the notes to the translation of the *Iliad*; and in the volumes of poetry published by Lintot, commonly called *Pope's Miscellanies*, many of his early pieces were inserted.

Pope and Broome were to be yet more closely connected. When the success of the *Iliad* gave encouragement to a version of the *Odyssey*, Pope, weary of the toil, called Fenton and Broome to his assistance; and taking only half the work upon himself, divided the other half between his partners, giving four books to Fenton and eight to Broome. Fenton's books are enumerated in Dr Johnson's life of him. To the lot of Broome fell the second, sixth, eighth, eleventh, twelfth, sixteenth, eighteenth, and twenty-third, together with the burden of writing all the notes. The price at which Pope purchased this assistance was three hundred pounds paid to Fenton and five hundred to Broome, with as many copies as he wanted for his friends, which amounted to one hundred more. The payment made to Fenton is known only by hearsay; Broome's is very distinctly told by Pope in the notes to the *Dunciad*. It is evident, that, according to Pope's own estimate, Broome was unkindly treated. If four books could merit three hundred pounds, eight and all the notes, equivalent at least to four, had certainly a right to more than six. Broome probably considered himself as injured, and there was for some time more than coldness between him and his employer. He always spoke of Pope as too much a lover of money, and Pope pursued him with avowed hostility; for he not only named him disrespectfully in the *Dunciad*, but quoted him more than once in the *Bathos*, as a proficient in the art of sinking: and in his enumeration of the different kinds of poets distinguished for the profound, he reckons Broome among "the parrots who repeat another's words in such a hoarse odd tone as makes them seem their own." It has been said that they were afterwards reconciled; but their peace was probably without friendship. He afterwards published a *Miscellany of Poems*, and never rose to very high dignity in the church. He was some time rector of Sturiton in Suffolk, where he married a wealthy widow; and afterwards, when the king visited Cambridge 1728, became doctor of laws. He was 1733 presented by the crown to the rectory of Pulham in Norfolk,

Broome.

which

Brooming
 Brother.

Brother.

which he held with Oakley Magna in Suffolk, given him by the lord Cornwallis, to whom he was chaplain, and who added the vicarage of Eye in Suffolk; he then resigned Puliam, and retained the other two. Toward the close of his life he grew again poetical, and amused himself with translating Odes of Anacreon, which he published in the Gentleman's Magazine under the name of *Chester*. He died at Bath in 1745, and was buried in the abbey church.

BROOMING, or *BREAMING* of a Ship, the washing and burning off all the filth she has contracted on her sides with weeds, straw, broom, or the like, when she is on the careen, or on the ground. See **CAREENING**.

BROSSARD (Sebastian de), an eminent French musician. In the former part of his life he had been prebendary and chapel-master of the cathedral church of Strasburg; but afterwards became grand-chaplain, and also maitre de chapelle in the cathedral of Meaux. There is extant of his a work entitled *Prodromus musicalis*. He was author also of a very useful book, entitled *Dictionnaire de musique*, printed at Amsterdam, in folio, 1703; and afterwards at the same place in octavo, without a date. At the end of this book is a catalogue of authors ancient and modern, to the amount of 900, who have written on music; divided into classes, wherein are interspersed many curious observations of the author relating to the history of music. By Mr Boivin's *Catalogue general des livres de musique* for the year 1729, it appears that Brossard was the author of two sets of motets, as also of nine *Lecons de Tenebres* therein mentioned. It seems that these several publications were at a time when the author was far advanced in years; for Walther takes notice, that in the *Mercure Galante*, he is mentioned as an abbé and composer, so early as the year 1678.

BROTHEL-HOUSES, lewd places, being the common habitations of prostitutes. King Henry VIII. by proclamation, in the 37th year of his reign, suppressed all the stews or brothel-houses which had long continued on the bank-side in Southwark, contrary to the law of God and of the land*. A brothelman was a loose idle fellow; and a *feme bordelier*, or *brothelier*, a common whore. And *broelman* is a contraction for *brothelman*. See **BAIRDY-HOUSE**.

BROTHER, *Frater*, a term of relation between two male children, sprung from the same father, or mother, or both. Scaliger and Vossius derive *frater* from *φρατρης*, for *φρατρης*, which properly signifies a person who draws water in the same well; *φρατρης* in Greek, signifying *well*, and *φρατρια*, a company of people, who have a right to draw water out of the same well.—The word, it is said, came originally from the city Argos, where there were only a few wells distributed in certain quarters of the city, to which those of the same neighbourhood alone repaired.

By the civil law, brothers and sisters stand in the second degree of consanguinity; by the canon law, they are in the first degree.—By the Mosaic law, the brother of a man who died without issue was obliged to marry the widow of the deceased. Deuter. xxv. 7.

The ancients applied the term brother indifferently to almost all who stood related in the collateral line, as uncles and nephews, cousin-germans, &c.—This we learn not only from a great many passages in the Old

Testament, but also from profane authors: Cicero, in his Philippics, says, "Antonia was both wife and sister of Mark Antony; because she was daughter of his brother C. Antonius." And as to cousins, Tullius Hostilius, in Dionysius Halicarnesseus, calls the Horatii and Curatii, brothers; because they were sisters children.

The language of the Jews, bishop Pearson observes, included in the name of brethren not only the strict relation of fraternity, but also the larger of consanguinity. We are brethren, says Abraham to Lot, Gen. xiii. 8. whereas Lot was only his nephew.—So Jacob told Rachel that he was her father's brother, Gen. xxix. 12. whereas he was only her father's nephew.—This consideration has been urged with good advantage against the Antidicomarianites, who, from the mention made of the brethren of Jesus, John ii. 12. Matth. xii. 46. have impugned the perpetual virginity of the mother of Christ.

Among us, it is customary for kings to give the title brother to each other; the unction in coronation being esteemed to create a kind of brotherhood. Nor is the custom modern: Menander mentions a letter of Cosroes king of Persia to the emperor Justinian, beginning thus: Cosroes, king of kings, &c. to the emperor Justinian my brother.—Kings now also give the same appellation to the electors of the empire; and the like was given by the king of France to the late king of Sardinia, while only duke of Savoy.

In the civil law, brothers, *fratres*, in the plural, sometimes comprehend sisters: as *Lucius & Titia, fratres; tres fratres, Titius, Mevius, & Seia*.

Foster-BROTHERS, those who sucked the same nurse. The French call them *fratres du lait*, or brothers by milk; which is most properly used in respect of a person who sucked a nurse at the same time with the nurse's own child.

BROTHERS-German, *Fratres Germani*. See **GERMAN**.

BROTHER was also used, in middle-age writers, for a *comes*, or governor of a province.

BROTHER is applied, in a less proper sense, to denote a person of the same profession. In which sense, judges, bishops, priests, &c. call each other brothers.

BROTHER is also a customary term for priests of the same persuasion to address one another by: but it is more particularly used to denote the relation between monks of the same convent; as, brother Zachary: in English, we more usually say, Friar Zachary, from the French word, *frere*, brother.—Preachers also call their hearers, *my brethren*, or *my dear brethren*. This appellation is borrowed from the primitive Christians, who all called each other *brothers*. But it is now principally used for such of the religious as are not priests: those in orders are generally honoured with the title of *father*, whereas the rest are only simply brothers.

BROTHER is also an appellation more peculiarly given to certain orders of religious: Thus, the

BROTHERS of *St Alexius*, in the low countries, were an order of persons who attended on those who lay dying, and took care of the burial of the dead. See also **BROTHERS** of *CHARITY*, of *DEATH*, &c.

POOR BROTHERS, in the charity-house, a denomination given to decayed gentlemen, to the number of 80, who are subsisted with diet, clothing, and lodging, on the establishment. The poor brothers are to be gentlemen

Brother
||
Broughton

lemen by descent, come to poverty, or decayed merchants, soldiers, or officers of the king's household. The conditions of admission are, that they have no estate for life worth 200 l. nor coming in, *viz* & *modis*, 24 l. *per annum*; and that they be fifty years old, unless they have been maimed in the public service; in which case, the age of forty suffices. They wear a livery-gown within doors.

BROTHERS of Arms, an appellation given those who contract a kind of fraternity in war, obliging themselves to the mutual service and assistance of each other. In the military orders, the knights are also called *brothers*.—In the order of Malta, there is a particular class, who are called *servoing brothers*; consisting of such as cannot give proof of their nobility. In Latin they are denominated *fratres clientes*.

BROTHERS of the 1057 cross. See ROSYCRUCIANS.

BROUAGE, a maritime town of Saintonge in France. It consists of five or six streets which terminate in a great square. It is famous for its salt-works, which are the finest in the kingdom. W. Long. 1. 0. N. Lat. 45. 50.

BROURSHAVEN, a port-town of the United Provinces, in the island of Schonen in Zealand, seated on the north side of the island, in a bay of the sea, in E. Long. 3. 35. N. Lat. 51. 50.

BROUGH, a town in Westmoreland in England, seated under Stanmore-hill, W. Long. 2. 50. N. Lat. 54. 40. It was formerly a place of great note, being a Roman fortress; but is now so much decayed, that it is little better than a village.

BROUGHTON (THOMAS), a learned divine, and one of the original writers of the *Biographia Britannica*, was born at London, July 5th 1704, in the parish of St Andrew, Holborn; of which parish his father was minister. At an early age he was sent to Eton school, where he soon distinguished himself by the acuteness of his genius, and the studiousness of his disposition. Being superannuated on this foundation, he removed about 1722 to the university of Cambridge; and, for the sake of a scholarship, entered himself of Gonville and Caius college. Here two of the principal objects of his attention were, the acquisition of the knowledge of the modern languages, and the study of the mathematics, under the famous professor Sanderson. May 28th 1727, Mr Broughton, after taking the degree of Bachelor of Arts, was admitted to deacon's orders. In the succeeding year, September 22d, he was ordained priest, and proceeded to the degree of M. A. At this time he removed from the university, to the curacy of Offley, in Hertfordshire. In 1739, he was instituted to the rectory of Stepington, otherwise Stibington, in the county of Huntingdon, on the presentation of John Duke of Bedford, and was appointed one of that nobleman's chaplains. Soon after he was chosen reader to the Temple, by which means he became known to bishop Sherlock, then master of it, and who conceived so high an opinion of our author's merit, that, in 1744, this eminent prelate presented Mr Broughton to the valuable vicarage of Bedminster, near Bristol, together with the chapels of St Mary Redcliff, St Thomas, and Abbot's Leigh, annexed. Some short time after, he was collated, by the same patron, to the prebend of Bedminster and Redcliff, in the cathedral of Salisbury.

Upon receiving this preferment, he removed from London to Bristol, where he married the daughter of Thomas Harris, clerk of that city, by whom he had seven children, six of whom survived him. He resided on his living till his death, which happened December 21st 1774, in the 71st year of his age. He was interred in the church of St Mary Redcliff.

From the time of Mr Broughton's quitting the university, till he was considerably advanced in life, he was engaged in a variety of publications, of which a list is given in the *Biographia Britannica*, 2d edition. Some little time before his death, he composed "A short view of the principles upon which Christian churches require, of their respective clergy, subscription to established articles of religion;" but this work never appeared in print. He possessed, likewise, no inconsiderable talent for poetry, as is evident from many little fugitive pieces in manuscript, found among his papers; and particularly from two unfinished tragedies, both written at the age of 17. When he was at Eton school, Mr Broughton was of the same year with Dr Ewer, late bishop of Bangor; Dr Sumner, late provost of King's college, Cambridge; and Dr Sleech, late provost of Eton: and during his residence in London, he enjoyed the esteem and friendship of most of the literary men of his time. He was a great lover of music, particularly the ancient; which introduced him to the knowledge and acquaintance of Mr Handel; whom he furnished with the words for many of his compositions. In his public character, Mr Broughton was distinguished by an active zeal for the Christian cause, joined with a moderation of mind. In private life, he was devoted to the interests and happiness of his family; and was of a mild, cheerful, and liberal temper. This disposition, which is not always united with eminent literary abilities, attended him to his grave. In 1778, a posthumous "volume of sermons, on select subjects," was published by his son, the Rev. Thomas Broughton, M. A. of Wadham college, Oxford, and vicar of Tiverton, near Bath.

BROUKHUSIUS (JONAS), or **JOHN BROEKHUIZEN**, a distinguished scholar in Holland, was born November 20. 1649, at Amsterdam, where his father was a clerk in the admiralty. He learned the Latin tongue under Hadrian Junius, and made a prodigious progress in polite literature; but, his father dying when he was very young, he was taken from literary pursuits, and placed with an apothecary at Amsterdam, with whom he lived some years. Not liking this, he went into the army, where his behaviour raised him to the rank of lieutenant-captain; and, in 1674, was sent with his regiment to America in the fleet under admiral de Ruyter, but returned to Holland the same year. In 1678, he was sent to the garrison at Utrecht, where he contracted a friendship with the celebrated Grævius; and here, though a person of an excellent temper, he had the misfortune to be so deeply engaged in a duel, that, according to the laws of Holland, his life was forfeited: but Grævius wrote immediately to Nicholas Heinfius, who obtained his pardon from the Stadtholder. Not long after, he became a captain of one of the companies then at Amsterdam; which post placed him in an easy situation, and gave him leisure to pursue his studies. His company being disbanded in 1697, a pension was granted him; upon which he retired

Broughton,
Broukhu-
sius.

Broucker retired to a country-house near Amsterdam, where he saw but little company, and spent his time among books. He died December 15th 1707.

Browallia. As a classical editor, he is distinguished by his labours upon Tibullus and Propertius; the latter was published in 1702, the former in 1708. He was an excellent Latin poet himself: a volume of his poems was published at Utrecht, 1684, in 12mo; but a very noble edition of them was given by Van Hoogstraeten at Amsterdam, 1711, in 4to. His "Dutch poems" were also published at Amsterdam, 1712, in 8vo, by the same person, who prefixed his life, extracted from Peter Burman's funeral oration upon him. Broukhufius was also an editor of Sannazarius's and Palearius's Latin works. With regard to his Latin poems, the authors of the "Journal de Trevoux" have delivered themselves thus (and what they have said may be applied to the bulk of modern Latin poems): "His verses are written in good Latin enough; but they want fire. We find in them a great many passages borrowed from Tibullus and Propertius, but not their genius. The author was a poet by art, not by nature."

BROUNCKER, or **BROUNKER**, (William), lord viscount of Castle-Lyons, in Ireland, and the first president of the Royal Society, was the son of Sir William Brounker, knt. and born about the year 1620. He was distinguished by his knowledge of the mathematics, and by the considerable posts of honour and profit he enjoyed after the restoration; for he had at the same time the office of chancellor to the queen, and the keeping of her great seal, that of one of the commissioners of the navy, and master of St Catherine's hospital near the Tower of London. He wrote, 1. Experiments of the recoiling of guns. 2. An algebraical paper upon the squaring of the hyperbola; and several letters to Dr Usher, archbishop of Armagh. He died in 1684.

BROUWER (Adrian), a famous Dutch painter, born either at Oudenard or Haerlem, in 1608, of poor parentage. He became the disciple of Francis Hals, under whom he proved an inimitable artist. His subjects were taken from low life, always copied from nature; as droll conversations, drunken brawls, hoors at cards, or surgeons dressing the wounded. Brouwer was apprehended at Antwerp as a spy; where being discovered by Rubens, he procured his liberty, took him home, clothed him, and endeavoured to acquaint the public with his merit; but the levity of his temper made him quit his benefactor: and he died not long after, in 1640, destroyed by a dissolute course of life.

BROW, or **EYE-BROW**, an hairy arch extended over the orbit of each eye. See **ANATOMY**, n^o 142.

BROW-POST, among builders, denotes a beam which goes across a building.

BROW-ANTLER, among sportsmen, that branch of a deer's horn next the tail.

BROWALLIA, in botany, a genus of the angiospermia order, belonging to the didynamia class of plants, for which there is no English name.—Of this there are two species. The demissa, with a single flower upon each footstalk; and the elata, with one or many flowers on each footstalk. The seeds of the first were sent to Mr Miller from Panama. It usually grows a-

bout two feet high, and spreads out into lateral branches on every side of the stalk, garnished with oval leaves which are entire, and have short footstalks. Towards the end of the branches, the flowers are produced singly upon pretty long footstalks arising from the wing of the leaf. These are of a light blue colour, sometimes inclining to a purple or red; and there are often three colours of flowers on the same plant. The plant flowers in July, August, and September; and the seeds are ripe in five or six weeks after. The second sort is a native of Peru: the stalk of this plant is twice the size of that of the first, and appears somewhat shrubby; the leaves upon the flower-branches are smooth: the footstalks have some with one flower, others with three, and others with five; which are of a deep violet colour. As both species of browallia are annual plants, they must be raised from seeds, which are to be sown on a hot-bed: but they may be transplanted in June, into the borders of the flower-garden; where, if the weather proves warm, they will flower and perfect seeds; but lest these should fail, there should be a plant or two kept in the stove to secure seeds.

BROWN (Robert), a schismatic divine, the founder of the Brownists, a numerous sect of dissenters in the reign of queen Elizabeth. He was the son of Mr Anthony Brown of Tolthorp in Rutlandshire; whose father obtained the singular privilege of wearing his cap in the king's presence, by a charter of Henry VIII. Robert was educated at Cambridge, in Corpus Christi, or, according to Collier, in Bennet college, and was afterwards a schoolmaster in Southwark. About the year 1580, he began to promulgate his principles of dissent from the established church; and the following year preached at Norwich, where he soon accumulated a numerous congregation. He was violent in his abuse of the church of England; pretended to divine inspiration, and that he alone was the sure guide to heaven. This new sect daily increasing, Dr Froke bishop of Norwich, with other ecclesiastical commissioners, called our apostle before them. He was insolent to the court, and they committed him to the custody of the sheriff's officer: but he was released at the intercession of lord treasurer Burleigh, to whom it seems he was related. Brown now left the kingdom; and, with permission of the states, settled at Middleburg in Zealand; where he formed a church after his own plan, and preached without molestation; but here persecution, the *sine qua non* of fanaticism, was wanting. In 1585, we find him again in England: for in that year he was cited to appear before archbishop Whitgift; and seeming to comply with the established church, was, by lord Burleigh, sent home to his father: but, relapsing into his former obstinacy, his aged parent was obliged to turn him out of his house. He now wandered about for some time, and in the course of his mission endured great hardships. At last he fixed at Northampton; where, labouring with too much indirection to increase his sect, he was cited by the bishop of Peterborough, and, refusing to appear, was finally excommunicated for contempt. The solemnity of this censure, we are told, immediately effected his reformation. He moved for absolution, which he obtained, and from that time became a dutiful member of the church of England. This happened about the year 1590; and,

Browallia,
Brown.

Brown. in a short time after, Brown was preferred to a rectory in Northamptonshire, where he kept a curate to do his duty, and where he might probably have died in peace: but having some dispute with the constable of his parish, he proceeded to blows; and was afterwards so insolent to the justice, that he committed him to Northampton jail, where he died in 1630, aged 80. Thus ended the life of the famous Robert Brown; the greatest part of which was a series of opposition and persecution. He boasted on his death-bed, that he had been confined in no less than 32 different prisons. He wrote "A treatise of reformation without tarrying for any, and of the wickedness of those teachers which will not reform themselves and their charge, because they will tarry till the magistrate command and compel them, by me Robert Brown;" and two others, making together a thin quarto; published at Middleburg, 1582.

BROWN (Ulysses Maximilian), a celebrated general of the 18th century, was son of Ulysses, baron Brown and Camus, colonel of a regiment of cuirassiers in the emperor's service, and descended from one of the most ancient and noble families in Ireland. He was born at Basil in 1705; and having finished his first studies at Limeric in Ireland, was, in 1715, sent for into Hungary, by count George Brown, his uncle, member of the aulic council of war, and colonel of a regiment of infantry. He was present at the famous battle of Belgrade, in 1717. Next year he followed his uncle into Italy, who made him continue his studies, in the Clementine college, at Rome, till the year 1721, when he was sent to Prague in order to learn the civil law. At the end of the year 1723, he became captain in his uncle's regiment; and in 1725, lieutenant-colonel: in 1730, he went into Corfica with a battalion of his regiment; and contributed greatly to the taking of Callanfara, where he received a considerable wound in his thigh. In 1732, the emperor made him chamberlain: He was raised to the rank of colonel in 1734; and distinguished himself so much in the war of Italy, especially at the battles of Parma and Guastalla, and in burning in the presence of the French army the bridge which the marshal de Noailles had caused to be thrown over the Adige, that he was made general in 1736. The following year he favoured the retreat of the army, after the unhappy battle of Banjuluca in Bosnia, by an excellent manœuvre, and saved all the baggage. His admirable conduct upon this occasion was rewarded by his obtaining a second regiment of infantry, vacant by the death of count Francis de Wallis.

At his return to Vienna, in 1739, the emperor Charles VI. raised him to the rank of general-field-marshal-lieutenant, and made him counsellor in the aulic council of war. After the death of that prince, the king of Prussia entering Silesia, count Brown, with a small body of troops, disputed the country with him inch by inch. He signalized himself on several other occasions: and, in 1743, the queen of Hungary made him a privy-counsellor. at her coronation in Bohemia. He at length passed into Bavaria, where he commanded the van-guard of the Austrian army; seized Deckendorf, with a great quantity of baggage; and obliged the French to abandon the banks of the Danube, which the Austrian army passed in full security. The same

Brown year, viz. in 1743, the queen of Hungary sent him to Worms, in quality of her plenipotentiary to the king of Britain; where he put the last hand to the treaty of alliance between the courts of Vienna, London, and Turin. In 1744, he followed 'prince Lobkowitz into Italy; took the city of Veletri, on the 4th of August, in spite of the superior numbers of the enemy; entered their camp, overthrew several regiments, and took many prisoners. The following year he was recalled into Bavaria, where he took the town of Wildshofen by assault, and received a dangerous shot in the thigh. The same year he was made general of the artillery; and in January 1746, marched for Italy, at the head of a body of 18,000 men. He then drove the Spaniards out of the Milanese; and having joined the forces under prince de Lichtenstein, commanded the left wing of the Austrian army at the battle of Placentia on the 15th of June 1746, and defeated the right wing of the enemy's forces commanded by marshal de Maillebois. After this victory, he commanded in chief the army against the Genoese; seized the pass of Bofetta or Bochetta, though defended by above 4000 men; and took the city of Genoa. Count Brown at length joined the king of Sardinia's troops; and took, in conjunction with him, Mont-Alban, and the county of Nice. On the 30th of November he passed the Var, in spite of the French troops; entered Provence; took the isles of St Margaret and St Honorat; and thought to have rendered himself master of a much greater part of Provence, when the revolution which happened in Genoa, and marshal de Belleisle's advancing with his army, obliged him to make that fine retreat which procured him the admiration and esteem of all persons skilled in war. He employed the rest of the year 1747 in defending the states of the house of Austria in Italy; and after the peace in 1748, he was sent to Nice to regulate there, in conjunction with the duke of Belleisle and the marquis de la Minas, the differences that had arisen with respect to the execution of some of the articles of the definitive treaty of Aix la Chapelle.

The empress queen, to reward these signal services, especially his glorious campaigns in Italy in 1749, made him governor of Transylvania, where he rendered himself generally admired for his probity and disinterestedness. In 1752, he obtained the government of the city of Prague, with the chief command of the troops in that kingdom; in 1753, the king of Poland, elector of Saxony, honoured him with the collar of the order of the white eagle; and the next year he was declared field-marshal.

The king of Prussia entering Saxony in 1756, and attacking Bohemia, count Brown marched against him; and repulsed that prince at the battle of Lobositz, on the 1st of October, though he had only 27,000 men, and the king of Prussia had at least 40,000. Seven days after this battle, he undertook the famous march into Saxony, to deliver the Saxon troops shut up between Pirna and Konigstein; an action worthy of the greatest captains, ancient or modern. He at length obliged the Prussians to retire from Bohemia; for which he was rewarded, by being made a knight of the golden fleece. Soon after, count Brown hastily assembled an army in Bohemia, to oppose the king of Prussia, who had again penetrated into

into that kind of glory at the head of all his forces; and on the 6th of May fought the famous battle of Prague; in which, while he was employed in giving his orders for maintaining the advantages he had gained over the Prussians, he was so dangerously wounded, that he was obliged to be carried to Prague, where he died of his wounds, on the 26th of June 1757, at 52 years of age. There is reason to believe, that, had he not been wounded, he would have gained the victory, as he had broken the Prussians, and the brave count Schwerin, one of their greatest generals, was slain.

Brown (Sir Thomas), an eminent physician and celebrated writer, was born at London, October 19th 1605. Having studied at Winchester college, and afterwards at Oxford, he travelled through France and Italy; and returning by the way of Holland, took his degree of doctor of physic at Leyden. In 1636, he settled at Norwich; and the year following, was incorporated as doctor of physic at Oxford. His *Religio Medici* made a great noise; and being translated into Latin, instantly spread throughout Europe, and gained him a prodigious reputation: it was then translated into almost every language in Europe. This book has been heavily censured by some, as tending to infidelity, and even atheism; while others, with much more reason, have applauded the piety, as well as the parts and learning, of the author. The reverend Mr Granger observes, that among other peculiarities in this book, he speaks of the ultimate act of love as a folly beneath a philosopher; and says, that he could be content that we might procreate, like trees, without conjunction: but, after the writing of it, he descended from his philosophic dignity, and married an agreeable woman. It was said, that his reason for marrying was, because he could discover no better method of procreation. His Treatise on Vulgar Errors was read with equal avidity; he also published *Hydriasthia*, or a Discourse of Sepulchral Urns lately found in Norfolk. His reputation in his profession was equal to his fame for learning in other respects; and therefore the college of physicians were pleased to take him into their number as an honorary member; and king Charles II. coming to Norwich in his progress, in 1671, was pleased to knight him, with singular marks of favour and respect. He died on his birth-day, in 1682, leaving several manuscripts behind him, which were published under the title of *The posthumous works of the learned Sir Thomas Brown, Knt. M. D.*

Brown (Edward), the son of the former, physician to king Charles II. and president of the royal college at London. He was born in the year 1642; and studied at Cambridge, and afterwards at Merton college, Oxford. He then travelled; and at his return published a brief account of some travels in Hungary, Servia, Bulgaria, Macedonia, Thessaly, Austria, Styria, Carinthia, Carniola, Friuli, &c.: he also published an account of several travels through great part of Germany; and joined his name to those of many other eminent men, in a translation of Plutarch's lives. He was acquainted with Hebrew, was a critic in Greek, and no man of his age wrote better Latin. High Dutch, Italian, French, &c. he spoke and wrote with as much ease as his mother-tongue. King Charles said of him, that "he was as learned as any

of the college, and as well bred as any at court." He died August 27th 1708.

Brown (William), an English poet of the 17th century, was descended from a good family, and born at Tavistock in Devonshire in the year 1590. After he had passed through the grammar school, he was sent to Exeter college in the university of Oxford, in the beginning of the reign of James I. and became tutor to Robert Dormer, who was afterwards earl of Carnarvon, and killed at Newbury battle, September 20th 1643. He is styled in the public register of the university, "a man well skilled in all kinds of polite literature and useful arts;" *cir omni humana literatura et bonarum artium cognitione instructus*. After he had left the college with his pupil, he was taken into the family of William earl of Pembroke, who had a great respect for him; and he made his fortune so well, that he purchased an estate. His poetical works procured him a very great reputation. They are as follow: 1. Britannia's pastorals. The first part was published at London, 1613, in folio; and uttered into the world with several copies of verses made by his ingenious and learned friends John Selden, Michael Drayton, Christopher Cook, &c. The second part was printed at London in 1616, and recommended by various copies of verses written by John Glanville, who afterwards became eminent in the profession of the law, and others. These two parts were reprinted in two vols. 8vo, 1625. 2. The shepherd's pipe, in seven eclogues; London, 1614, in 8vo. 3. An elegy on the never-enough bewailed death of prince Henry, eldest son of king James I. Mr Wood tells us, that it is probable our author wrote several other poems which he had not seen. It is uncertain when he died.

Brown (Thomas), "of facetious memory," as he is styled by Addison, was the son of a farmer in Shropshire; and entered in Christ-church college, Oxford, where he soon distinguished himself by his uncommon attainments in literature. But the irregularities of his life not suffering him to continue long there, he, instead of returning to his father, went to London to seek his fortune: his companions, however, being more delighted with his humour than ready to relieve his necessities, he had recourse to the usual refuge of half-starved wits, scribbling for bread; and published a great variety of poems, letters, dialogues, &c. full of humour and erudition, but often indelicate. Though a good-natured man, he had one pernicious quality, which was, rather to lose his friend than his joke.

Towards the latter end of Tom Brown's life, we are informed by Mr Jacob, that he was in favour with the earl of Dorset, who invited him to dinner on a Christmas day, with Mr Dryden and some other gentlemen celebrated for their ingenuity, (as his lordship's custom was); when Mr Brown to his agreeable surprise found a bank note of 50*l.* under his plate, and Mr Dryden at the same time was presented with another of 100*l.* Mr Brown died in the year 1704; and was interred in the cloister of Westminster abbey, near the remains of Mrs Behn, with whom he was intimate in his lifetime. His works have been printed both in 8vo and 12mo, making 4 vols.

Brown (Dr John), a clergyman of the church of England, and an ingenious writer, was born at Roth-

Brown. bury in Northumberland in November 1715. His father John Brown, was a native of Scotland, of the Browns of Colstoun near Haddington; and at the time of his son's birth was curate to Dr Thomlinson rector of Rothbury. He was afterwards collated to the vicarage of Wigton in Cumberland; to which place he carried his son, who received the first part of his education there. Thence he was removed in 1732 to the university of Cambridge, and entered of St John's college, under the tuition of Dr Tunstall. After taking the degree of bachelor of arts with great reputation (being amongst the list of wranglers, and his name at the head of the list), he returned to Wigton, and received both deacon's and priest's orders from Sir George Fleming bishop of Carlisle. Here he was appointed by the dean and chapter a minor canon and lecturer of the cathedral church. For some years he lived here in obscurity; and nothing farther is known concerning him, than that in 1739 he went to Cambridge to take his degree of master of arts. In 1745 he distinguished himself as a volunteer in the king's service, and behaved with great intrepidity at the siege of Carlisle. After the defeat of the rebels, when several of them were tried at the assizes held at Carlisle in the summer of 1746, he preached at the cathedral church of that city two excellent discourses, on the mutual connection between religious truth and civil freedom; and between superstition, tyranny, irreligion, and licentiousness.

Mr Brown's attachment to the royal cause and to the Whig party procured him the friendship of Dr Osbaldeston, who was the only person that continued to be his friend through life; the peculiarities of Mr Brown's temper, or some other cause, having produced quarrels with every one else. When Dr Osbaldeston was advanced to the see of Carlisle, he appointed Mr Brown to be one of his chaplains.

It was probably in the early part of his life, and during his residence at Carlisle, that Mr Brown wrote his poem intitled *Honour*, inscribed to the lord viscount Londsdale. Our author's next poetical production was his *Essay on Satire*; and which was of considerable advantage to him both in point of fame and fortune. It was addressed to Dr Warburton; to whom it was so acceptable, that he took Mr Brown into his friendship, and introduced him to Ralph Allen, Esq; of Prior Park, near Bath, who behaved to him with great generosity, and at whose house he resided for some time.

In 1751 Mr Brown published his "Essays on the Characteristics of Lord Shaftesbury, &c." dedicated to Ralph Allen, Esq. This was received with a high degree of applause, though several persons attempted to answer it. In 1754 our author was promoted by the earl of Hardwicke to the living of Great Horkeley in Essex.

In 1755, our author took the degree of doctor of divinity at Cambridge. This year he published his tragedy of Barbarossa; which, under the management of Mr Garrick, was acted with considerable applause; but when it came to be published, it was exposed to a variety of strictures and censures. This tragedy introduced our author to the acquaintance of that eminent actor; by whose favour he had a second tragedy, named *Athelstan*, represented

N^o 59.

Brown. at Drury-Lane play-house. This was also well received by the public; but did not become so popular as Barbarossa, nor did it preserve so long the possession of the stage.

In 1757 appeared his famous "Estimate of the Manners and Principles of the Times." The reception which this work met with from the public was very flattering to his vanity; no fewer than seven editions of it having been printed in little more than a year. The chief design of this performance was to show, that a vain, luxurious, and selfish effeminacy in the higher ranks of life marked the character of the age; and to point out the effects and sources of this effeminacy. Several antagonists appeared, some of whom were neither destitute of learning nor ingenuity; though Dr Brown himself asserted that Mr Wallace, a clergyman of Edinburgh, was the only candid and decent adversary that appeared against him. The testimony given by M. de Voltaire to the effect which the Estimate had on the conduct of the nation, is very honourable to Dr Brown. "When Marshal Richelieu, in 1756, (says that celebrated writer), laid siege to Port Mahon, the capital of Minorca, the British sent out admiral Byng with a strong naval force, to drive the French fleet off the island, and raise the siege. At this time there appeared a book, entitled *An Estimate of the Manners of the Times*; of which there was no less than five editions printed off in London in the space of three months. In this treatise the author proves that the English nation was entirely degenerated;—that it was near its ruin;—that its inhabitants were no longer so robust and hardy as in former times;—and that its soldiers had lost their courage. —This work roused the sensibility of the English nation, and produced the following consequences. They attacked, almost at one and the same time all the sea coasts of France, and her possessions in Asia, Africa, and America." In 1758, our author published the second volume of his Estimate of the Manners and Principles of the Times; containing additional remarks on the ruling manners and principles, and on the public effects of those manners and principles. The design of this volume was, to retract such mistakes as he thought he had committed; to prove such points as were affirmed and not proved; to illustrate those particulars which were hinted, but not explained; to reply to such capital objections as had been made to his general system by preceding writers on the same subject; and to display the consequences which might be fairly deduced from his principles, and through a designed brevity were omitted in the first volume. But it unfortunately happened that the Doctor's self-opinion, which gave so much offence in his first volume, broke out in the second with still greater violence. The consequence of this was, that he exposed himself to general censure and dislike; and the prejudices against him occasioned the real excellencies of the work to be very much overlooked. The periodical critics, whom he had gone needlessly out of his way to abuse, treated him with uncommon severity; and such a multitude of antagonists rose against him, so many objections were urged upon him, by friends as well as enemies, that he seems to have been deeply impressed, and to have retired for a while into the country. From the country it was

5

that

Brown. that he wrote, in a series of letters to a noble friend, "An Explanatory Defence of the Estimate of the Manners and Principles of the Times; being an appendix to that work, occasioned by the clamours lately raised against it among certain ranks of men."

But while Dr Brown thus distinguished himself as a political writer, he was advanced to no higher dignity in the church: nay, on some disgust, it is supposed, he resigned his living in Essex: however, in recompence, Dr Osbaldeston procured him the rectory of St Nicholas in Newcastle on Tyne. He would probably have received further favours from this prelate, had not the latter died soon after his promotion to the see of London.

In 1765 our author published an Additional Dialogue of the Dead, between Pericles and Aristides; being a sequel to a dialogue of lord Lyttleton's between Pericles and Cosino. One design of this additional dialogue was to vindicate the measures of Mr Pitt, against whose administration lord Lyttleton had been supposed to have thrown out some hints. Our author's next publication, in 1763, was "The cure of Saul," a sacred ode; which was followed in the same year by "A Dissertation on the Rise, Union, and Power, the Progressions, Separations, and Corruptions of Poetry and Music." This is one of the most pleasing of Dr Brown's performances, and abounds with a variety of critical discussions. A number of strictures on this piece were published; and the Doctor defended himself in a treatise intitled *Remarks on some Observations on Dr Brown's Dissertations on Poetry and Music*. In 1764 our author published, in octavo, "The History of the Rise and Progress of Poetry through its several Species;" which is no more than the substance given in the dissertation abovementioned. The same year Dr Brown published a volume of sermons, dedicated to his patron Dr Osbaldeston bishop of London; but most, if not all, of these, had been separately published, excepting the first three, which were on the subject of education. In the beginning of the year 1765, the Doctor again returned to politics, and published "Thoughts on Civil Liberty, Licentiousness, and Faction." At the conclusion of this work the author prescribed a code of education, upon which Dr Priestley made remarks at the end of his "Essay on the Course of a liberal Education for civil and active Life." The same year he published a sermon "On the Female Character and Education," preached on the 16th of May 1765, before the guardians of the asylum for deserted female orphans. His last publication was in 1766, "A Letter to the Rev. Dr Lowth, occasioned by his late Letter to the Right Rev. Author of the Divine Legation of Moses." This was occasioned by Dr Lowth's having *clearly, though indirectly,* pointed at Dr Brown as one of the extravagant adulators and defenders of bishop Warburton. Besides these works, Dr Brown published a poem on Liberty, and two or three anonymous pamphlets. At the end of several of his later writings, he advertised his design of publishing "Christian Principles of Legislation," but was prevented from executing it by his death; though the work appears to have been completed.

We come now to the concluding events of our author's life; concerning which the following is the most authentic intelligence that can be procured. Whilst

Dr Dumaresq resided in Russia in the year 1765, to which he had been invited the preceding year to give his advice and assistance for the establishment and regulation of several schools which her Imperial majesty intended to erect, he received a letter from a lady of distinguished character in England, recommending to him Dr Brown as a proper correspondent on this occasion. Dr Dumaresq then wrote a letter to Dr Brown, telling him the occasion of his application, and the difficulties that occurred. He had imagined that nothing more would be wanted of him than what concerned classical learning, and a general foundation for the sciences; as that had been the common introduction to every kind of useful knowledge in the western parts of Europe. But on his arrival he found that a much more extensive scheme was required; and such as extended not only to learning properly so called, but also to matters military and naval, civil and commercial. But having stated his difficulties in executing this plan to Dr Brown, the latter proposed a scheme still more extensive; and which was no less than a general plan of civilization throughout the whole Russian empire. In this plan, however, though it showed very enlarged ideas and great strength of mind, there were several defects which rendered it, as Dr Brown himself was afterwards convinced, impracticable. He had laid greater stress upon the support, energy, and efficacy of absolute power in princes when exerted in a good cause, than experience would warrant; and he was ready to imagine that the bulk of the Russian nation, just emerging out of barbarism, was like a *tabula rasa*, upon which any characters might be written. At last the Doctor's letter was laid before the empress, who was so pleased with it that she immediately invited him to Russia. He accepted the invitation, and procured his Majesty's leave to go; 1000*l.* were ordered for his expence, and he actually received 200*l.* But when he was on the point of setting out, an attack of the gout and rheumatism, to which he had been all his lifetime subject, so impaired his health, that his friends dissuaded, and at last succeeded in preventing him from going. The money was returned, excepting 97*l.* 6*s.* which had been expended in necessaries for the intended journey. But though he thus declined the journey, a long letter which he afterwards wrote to the empress, and which does honour to his abilities, shows that he had not abandoned his intention of being serviceable. The affair, however, taking in all its circumstances, did no doubt greatly agitate his mind; and his being obliged at length to give up the journey, must have been no small disappointment to a man of his sanguine expectations. This disappointment concurring with the general state of his health, and perhaps the recollection of some other failures that had happened, was followed by a dejection of spirits; in consequence of which he put an end to his life on the 23d of September 1766, in the 51st year of his age. On the morning of that day his servant came into his bed-chamber, and asked him what sort of a night he had had? to which he replied, "A pretty good one." The servant having quitted the bed-side for a few minutes, heard a noise in the Doctor's throat, which he imagined to be owing to some obstruction occasioned by phlegm. Going to assist his matter, he found him speechless, and bleeding profuse-

Brown. ly, having cut the jugular vein with a razor; and this he had done so effectually, that death speedily ensued. Such was the unhappy end of this ingenious writer; but the manner of it, when some previous circumstances of his life are understood, will cast no stain on his character. He had a tendency to insanity in his constitution; and, from his early life, had been subject at times to some disorder in his brain, at least to melancholy in its excess. Mrs Gilpin of Carlisle, soon after Dr Brown's decease, wrote in the following terms in a letter to a friend. "His distemper was a frenzy, to which he had by fits been long subject; to my own knowledge, above 30 years. Had it not been for Mr Farish frequently, and once for myself, the same event would have happened to him long ago. It was no premeditated purpose in him; for he abhorred the thought of self-murder; and in bitterness of soul expressed his fears to me, that one time or another some ready mischief might present itself to him, at a time when he was wholly deprived of his reason."

Brown (Simon), a dissenting minister, whose uncommon talents and singular misfortunes intitle him justly to a place in this work, was born at Shepton Mallet in Somersetshire. 1680. Grounded and excelling in grammatical learning, he early became qualified for the ministry, and actually began to preach before he was twenty. He was first called to be a pastor at Portsmouth, and afterwards removed to the Old Jewry, where he was admired and esteemed for a number of years. But the death of his wife and only son, which happened in 1723, affected him so as to deprive him of his reason; and he became from that time lost to himself, to his family, and to the world: his congregation at the Old Jewry, in expectation of his recovery, delayed for some time to fill his post; yet at length all hopes were over, and Mr Samuel Chandler was appointed to succeed him in 1725. This double misfortune affected him at first in a manner little different from distraction, but afterwards sunk him into a settled melancholy. He quitted the duties of his function, and would not be persuaded to join in any act of worship, public or private. Being urged by his friends for a reason of this extraordinary change, at which they expressed the utmost grief and astonishment, he told them, after much importunity, that "he had fallen under the sensible displeasure of God, who had caused his rational soul gradually to perish, and left him only an animal life in common with brutes: that, though he retained the human shape, and the faculty of speaking in a manner that appeared to others rational, he had all the

Brown. while no more notion of what he said than a parrot; that it was therefore profane in him to pray, and incongruous to be present at the prayers of others;" and, very consistently with this, he considered himself no longer as a moral agent, or subject of either reward or punishment. In this way of thinking and talking he unalterably and obstinately persisted to the end of his life; though he afterwards suffered, and even requested, prayers to be made for him. Some time after his secession from the Old Jewry, he retired to Shepton Mallet, his native place; and though in this retirement he was perpetually contending that his powers of reason and imagination were gone, yet he was as constantly exerting both with much activity and vigour. He amused himself sometimes with translating parts of the ancient Greek and Latin poets into English verse: he composed little pieces for the use of children; an English Grammar and Spelling Book; An Abstract of the Scripture-History, and A Collection of Fables, both in metre; and with much learning he brought together into a short compass all the *Themata* of the Greek and Latin tongues, and also compiled a Dictionary to each of those works, in order to render the learning of both these languages more easy and compendious. Of these performances none have been made public. But what showed the strength and vigour of his understanding, while he was daily bemoaning the loss of it, were two works composed during the two last years of his life, in defence of Christianity, against Woolston and Tindal. He wrote an answer to Woolston's fifth Discourse on the Miracles of our Saviour, entitled, A fit rebuke for a ludicrous Infidel, with a preface concerning the prosecution of such writers by the civil power. The preface contains a vigorous plea for liberty, and is strongly against prosecutions in matters of religion; and in the Answer, Woolston is as well managed as he was by any of his refuters, and more in his own way too. His book against Tindal was called, A Defence of the Religion of Nature and the Christian Revelation, against the defective account of the one and the exceptions against the other, in a book entitled, Christianity as old as the Creation; and it is allowed to be as good a one as that controversy produced. He intended to dedicate it to queen Caroline; but as the unhappy state of his mind appeared in the dedication, some of his friends very wisely suppressed it, as sure to defeat the use and intent of his work. The copy however was preserved, and is subjoined in the note (A), as much too great a curiosity to be suppressed. The above pieces were published.

(A) Madam, Of all the extraordinary things that have been rendered to your royal hands since your first happy arrival in Britain, it may be boldly said, what now bespeaks your majesty's acceptance is the chief. Not in itself indeed: it is a trifle unworthy your exalted rank, and what will hardly prove an entertaining amusement to one of your majesty's deep penetration, exact judgment, and fine taste; but on account of the author, who is the first being of the kind, and yet without a name. He was once a man, and of some little name; but of no worth, as his present unparalleled case makes but too manifest: for, by the immediate hand of an avenging God, his very thinking substance has for more than seven years been continually wasting away, till it is wholly perished out of him, if it be not utterly come to nothing. None, no, not the least remembrance of its very ruins remains; not the shadow of an idea is left; nor any sense, so much as one single one, perfect or imperfect, whole or diminished, ever did appear to a mind within him, or was perceived by it. Such a present from such a thing, however worthless in itself, may not be wholly unacceptable to your majesty, the author being such as history cannot parallel; and if the fact, which is real, and no fiction or wrong conceit, obtains credit,

Brown.

Brown.

ed by Mr, afterwards Dr W. Harris, who, in an advertisement to the reader, recommends the afflicted case of the author, under a deep and peculiar melancholy, to the compassion and prayers of all his friends, and every serious Christian. Mr Brown survived the publication of this last work a very short time. A complication of distempers, contracted by his sedentary life (for he could not be prevailed on to refresh himself with air and exercise), brought on a mortification, which put a period to his labours and sorrows about the latter end of 1732. He was unquestionably a man of uncommon abilities and learning: his management of Woolston showed him to have also vivacity and wit: and, notwithstanding that strange conceit which possessed him, it is remarkable that he never appeared feeble or absurd, except when the object of his frenzy was before him. Besides the two pieces above mentioned, and before he was ill, he had published some single Sermons, together with a Collection of Hymns and Spiritual Songs. He left several daughters.

Brown (Isaac Hawkins), an ingenious English poet, was born at Burton upon Trent, Staffordshire, Jan. 21. 1705-6; of which place his father was the minister. He received his grammatical institution first at Lichfield, then at Westminster; whence, at sixteen years of age, he was removed to Trinity college, Cambridge, of which his father had been fellow. He remained there till he had taken a master of arts degree; and about 1727, settled himself in Lincoln's Inn, where he seems to have devoted more of his time to the Muses than to the law. Soon after his arrival there, he wrote a poem on *Dignity and Beauty*, which he addressed to Mr Highmore the painter, for whom he had a great friendship. Several other poetical pieces were written here, and particularly his *Pipe of Tobacco*. This is in imitation of Cibber, Ambrose, Phillips, Thomson, Young, Pope, and Swift, who were then all living; and is reckoned one of the most pleasing and popular of his performances. In 1743-4, he married the daughter of Dr Trinnell, archdeacon of Leicester.

He was chosen twice to serve in parliament, first in 1744, and afterwards in 1748; both times for the borough of Wenlock in Shropshire, near which place he possessed a considerable estate, which came from his maternal grandfather, Isaac Hawkins, Esq. In 1754, he published what has been deemed his capital work, *De Animi Immortalitate*, in two books; in which, besides a most judicious choice of matter and arrangement, he is thought to have shown himself not a servile but happy imitator of Lucretius and Virgil. The universal applause and popularity of this poem produced several English translations of it in a very short time; the best of which is that by Soame Jenyns, Esq; printed in his *Miscellanies*. Mr Brown intended to have added a third part, but went no farther than to leave a fragment. This excellent person died, after a lingering illness, in 1760, aged 55. In 1768, the present Hawkins Brown, Esq; obliged the public with an elegant edition of his father's poems, in large octavo; to which is prefixed a print of the author, from a painting of Mr Highmore, engraved by Ravenet.

Brown (Sir William), a noted physician and multifarious writer, was settled originally at Lynn in Norfolk, where he published a translation of Dr Gregory's Elements of Catoptries and Dioptries; to which he added, 1. A Method for finding the Foci of all Spectacles, as well as Lenses universally; as also magnifying or lessening a given Object by a given Speculum or Lens, in any assigned Proportion. 2. A Solution of those Problems which Dr Gregory has left undemonstrated. 3. A particular Account of Microscopes and Telescopes, from Mr Huygens; with the Discoveries made by Catoptries and Dioptries. Having acquired a competence by his profession, he removed to Queen's Square, Ormond Street, London, where he resided till his death. By his lady, who died 1763, he had one daughter, grandmother to the present Sir Martin-Brown Folkes, bart. A great number of lively essays, both in prose and verse, the production of his pen, were printed and circulated among his friends. The active

4 Z 2

part

credit, it must be recorded as the most memorable, and indeed astonishing, event in the reign of George II. that a tract, composed by such a thing, was presented to the illustrious Caroline: his royal consort needs not be added; fame, if I am not misinformed, will tell that with pleasure to all succeeding times. He has been informed, that your majesty's piety is as genuine and eminent as your excellent qualities are great and conspicuous. This can indeed be truly known to the great Searcher of hearts only. He alone, who can look into them, can discern if they are sincere, and the main intention corresponds with the appearance; and your majesty cannot take it amiss if such an author hints, that his secret approbation is of infinitely greater value than the commendation of men, who may be easily mistaken, and are too apt to flatter their superiors. But, if he has been told the truth, such a case as his will certainly strike your majesty with astonishment; and may raise that commiseration in your royal breast, which he has in vain endeavoured to excite in those of his friends: who, by the most unreasonable and ill-founded conceit in the world, have imagined, that a thinking being could for seven years together live a stranger to its own powers, exercises, operations, and state; and to what the great God has been doing in it and to it. If your majesty, in your most retired address to the King of kings, should think of so singular a case, you may perhaps make it your devout request, that the reign of your beloved sovereign and consort may be renowned to all posterity by the recovery of a soul now in the utmost ruin, the restoration of one utterly lost, at present amongst men. And should this case affect your royal breast, you will recommend it to the piety and prayers of all the truly devout who have the honour to be known to your majesty: many such doubtless there are, though courts are not usually the places where the devout resort, or where devotion reigns. And it is not improbable, that multitudes of the pious throughout the land may take a case to heart, that under your majesty's patronage comes thus recommended. Could such a favour as this restoration be obtained from heaven by the prayers of your majesty, with what transport of gratitude would the recovered being throw himself at your majesty's feet, and, adoring the divine power and grace, profess himself, Madam, your majesty's most obliged and dutiful servant,

SIMON BROWN.

Brownists.

part taken by Sir William Brown in the conteit with the licentiates, 1768, occasioned his being introduced by Mr Foote in his *Devil upon Two Sticks*. Upon Foote's exact representation of him with his identical wig and coat, tall figure, and glass itiffly applied to his eye, he sent him a card complimenting him on having so happily represented him; but as he had forgot his muff, he had sent him his own. This good-natured method of resenting disarmed Foote. He used to frequent the annual ball at the ladies boarding-school, Queen Square, merely as a neighbour, a good-natured man, and fond of the company of sprightly young folks. A dignitary of the church being there one day to see his daughter dance, and finding this upright figure stationed there, told him he believed he was *Hermippus ridicivus* who lived *anbelitu puellarum*. When he lived at Lynn, a pamphlet was written against him: he nailed it up against his house-door. At the age of 80, on St Luke's day, 1771, he came to Batson's coffee-house in his laced coat and band, and fringed white gloves, to show himself to Mr Crosby, then lord mayor. A gentleman present observing that he looked very well, he replied, *he had neither wife nor debts*. He died in 1774, at the age of 82; and by his will he left two prize-medals to be annually contended for by the Cambridge poets.

BROWN, among dyers, painters, &c. a dusky colour inclining towards redness. Of this colour there are various shades or degrees, distinguished by different appellations; for instance, Spanish-brown, a sad-brown, a tawney-brown, the London brown, a clove-brown, &c.

Spanish brown is a dark dull red, of a horse-flesh colour. It is an earth; and is of great use among painters, being generally used as the first and priming colour that they lay upon any kind of timber-work in house-painting. That which is of the deepest colour, and freest from stones, is the best. Though this is of a dirty brown colour, yet it is much used, not to colour any garment, unless it be an old man's gown; but to shadow vermilion, or to lay upon any dark ground behind a picture, or to shadow yellow berries in the darkest places, when you want lake, &c. It is best and brightest when burnt in the fire till it be red-hot; although, if you would colour any hare, horse, dog, or the like, it should not be burnt; but, for other uses, it is best when it is burnt; as for colouring wood, posts, bodies of trees, or any thing else of wood, or any dark ground of a picture.

BROWNIA, in botany; a genus of the endecandria order, belonging to the monadelphia class of plants. The calyx is blind, the corolla double, the exterior quinquefid, and the interior pentapetalous. There is but one species, the coccinea, a native of the West Indies.

BROWNISTS, a religious sect, which sprung out of the Puritans, towards the close of the 16th century: their leader, Robert Brown, wrote divers books in their behalf, was a man of good parts, and some learning. He was born of a good family in Rutlandshire, and related to the lord-treasurer Burleigh. He had been educated at Cambridge; but first published his notions, and began to inveigh openly against the discipline and ceremonies of the church, at Norwich, in the year 1580, from which time he underwent di-

vers persecutions from the bishops; insomuch that he boasted he had been committed to no less than 32 prisons, in some of which he could not see his hand at noon-day. At length, with his congregation, he left the kingdom, and settled at Middleburgh in Zealand; where they obtained leave of the states to worship God in their own way, and form a church according to their own model; which they had not long done before this handful of men, just delivered from the severities of the bishops, began to differ among themselves, and crumble into many parties, that Brown their pastor grew weary of his office; and, returning to England in 1589, renounced his principles of separation, and was preferred to the rectory of a church in Northamptonshire, and died, after leading a very idle and dissolute life, in 1630.

The revolt of Brown was attended with the dissolution of the church at Middleburgh; but the seeds of Brownism, which he had sown in England, were so far from being destroyed, that Sir Walter Raleigh, in a speech in 1592, computes no less than 20,000 followers of it. The occasion of their separation was not any fault they found with the faith, but only with the discipline and form of government of the other churches in England. They equally charged corruption on the episcopal form, and on that of the presbyterians, by consistories, classes, and synods: nor would they join with any other reformed church, because they were not assured of the sanctity and regeneration of the members that composed it; on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church; maintaining, that matrimony being a political contract, the confirmation thereof ought to come from the civil magistrate. They would not allow any children to be baptized of such as were not members of the church, or of such as did not take sufficient care of those baptized before. They rejected all forms of prayer; and held that the Lord's prayer was not to be recited as a prayer, being only given for a rule or model whereon all our prayers are to be formed. The form of church-government which they established was democratical. When a church was to be gathered, such as desired to be members of it made a confession of it, and signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. Their church-officers were chosen from among themselves, for preaching the word, and taking care of the poor, and separated to their several offices by fasting, prayer, and imposition of hands of some of the brethren. But they did not allow the priesthood to be any distinct order, or to give any indelible character. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word and administer the sacraments among them, so the same power could discharge him from his office, and reduce him to a mere layman again. And as they maintained the bounds of a church to be no greater than what could meet together in one place and join in one communion, so the power of these officers was prescribed within the same limits. The minister or pastor of one church could not administer the Lord's supper

Brown supper to another, nor baptize the children of any but those of his own society. Any lay-brother was allowed the liberty of prophesying, or of giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrines that had been preached. In a word, every church on the Brownists model is a body-corporate, having full power to do every thing which the good of the society requires, without being accountable to any classis, synod, convocation, or other jurisdiction whatever. Most of their discipline has been adopted by the Independents, a party which afterwards arose from among the Brownists. The laws were executed with great severity on the Brownists; their books were prohibited by queen Elizabeth, and their persons imprisoned, and many of them were hanged. The ecclesiastical commission and the star-chamber, in fine, distressed them to such a degree, that they resolved to quit their country. Accordingly, many families retired and settled at Amsterdam, where they formed a church, and chose Mr Johnson their pastor; and after him Mr Ainsworth, author of the learned commentary on the Pentateuch. Their church flourished near 100 years. See INDEPENDENTS.

BROWN, the name of a serviceable kind of sprite, who, according to a superstitious notion formerly prevalent in the Hebrides and Highlands of Scotland (as well as among the country people in England, where he had the name of *Robin Goodfellow*), was wont to clean the houses, helped to churn, threshed the corn, and would belabour all that pretended to make a jest of him. He was represented as stout and blooming, had fine long flowing hair, and went about with a wand in his hand. He was the very counter part of Milton's *Lubber Fiend*, who

Tells how the drudging goblin swet,
To earn his cream-bowl duly fet,
When in one night, ere glimpse of morn,
His shadowy flail hath thresh'd the corn,
That ten day-lab'ers could not end;
Then lies him down the Lubber Fiend,
And, stretch'd along the chimney's length,
Basks at the fire his hairy strength.

BROWSE, the tops of the branches of trees, whereon beasts feed. This is sometimes also called *broace* and *bruttle*; probably from the French *brouet*, which signifies the same thing.

Browse more properly denotes the food which deer find in young copes, continually sprouting anew.

BRUCE (Robert), son of the earl of Carrick, being competitor with Baliol for the crown of Scotland, lost it by the arbitration of Edward I. of England, for generously refusing to hold the crown of Scotland as depending on him, which his ancestors had left him independent. But Baliol having afterward broke his agreement with Edward, Bruce was easily persuaded by that king to side with him against Baliol, upon promise that he would settle him on the throne. Having contributed much to the breaking of Baliol's party, he demanded the accomplishment of king Edward's promise, who is said to have given him this answer: "What! have I nothing else to do but to conquer kingdoms for you?" However, he recovered his crown, defeated the English in several battles, raised

the glory of the Scots, and extended their dominions. See *History of Scotland*.

BRUCHSAL, a town of Germany, in the palatinate of the Rhine, and bishopric of Spire, situated on the river Satz, in L. Long. 8. 30. N. Lat. 49. 15.

BRUCHUS, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are filiform, and gradually increase in thickness. There are seven species, viz. 1. The pili, has grey elytra interspersed with white spots, and a white fundament with two black spots. It is a native of North America, and destroys whole fields of pease: It is now found in several of the southern parts of Europe; where it does great injury to the corn. 2. The theobroma, with whitish elytra interspersed with black points. It frequents the theobroma or chocolate-trees in the East Indies. 3. The gleditiae, with striated elytra of the same length with the belly, a pitch-coloured body, and green feelers. It is a native of America. 4. The bactris, with smooth elytra, a hoary body, and the hind part of the thighs oval. It frequents the palm-trees of Jamaica. 5. The granarius, has black elytra; the fore-feet are red, and the hind-feet are dentated. It frequents the seeds of plants in different parts of Europe. 6. The feminarius is black, with the base of the feelers and fore-feet testaceous. It is about the size of a louse, and a native of Europe. 7. The pesticornis, with comb-shaped feelers longer than the body. It is a native of Barbary and China.

BRUEGHEL. See **BRUEGHEL**.

BRUGES, a city of the Austrian Netherlands, capital of the territory of Bruges, with a bishop's see. It is seated in a plain eight miles from the sea; and has a great number of canals, made for the benefit of trade, one of which leads to Ghent, another to Oflend, another to Shuys, to Newport, to Furnes, to Ypres, and to Dunkirk, which you may reach in a day in the summer-time. All the waters about Bruges are without any current; but they may be changed in half an hour's time, by opening the sluices, and letting the water run into the sea. There are several bridges about the city, and that which was built in 1739 of free stone is very stately.

Bruges was in a very flourishing condition upwards of 200 years ago, and every nation had a consul here-in for the maintenance of their rights and privileges; but since the enlargement of Amsterdam and Antwerp, the trade is diminished, and its inhabitants are not numerous enough for so large a place. However, there are many rich merchants, and a chamber for trade. There are several fine churches; in the first rank of which is the cathedral, whose rich ornaments and treasure deserve notice. The finest square in the city is the great market, in which stand the halls, with public galleries, and a large court in the middle, and on one of its sides a high steeple supported only with four pillars. It is full of bells, with the most harmonious chimes in all the country. On the side of the great square there is a structure which serves for a public magazine to lay cloth in. It is built on a canal, and supported by pillars in such a manner, that small vessels can pass under it, to cross the city from the canal of Oflend to that of Ghent.

The square where the Wednesday's market is kept is very fine; for it contains several walks between two

Bruegel sal
||
Bruges.

Bruges
||
Brumalia.

rows of trees, and a new guard-house in the middle. The Burg is a large square, in which is the town-house, built in the Gothic manner, and adorned with a variety of figures of the ancient counts and countesses of Flanders. In the same square there are several other public buildings. The church dedicated to the Virgin Mary is very fine, with a high steeple, which serves as a sea-mark for the ships that come to Ostend; on the inside are two tombs of copper gilt, of an extraordinary magnificence. Besides the cathedral and two collegiate churches, there are five parish churches, fourteen chapels, and twelve convents for men and women. There are a great many alms houses and hospitals, one of which is called the *school of Bosards*, where there are about 180 boys, some of which are brought up to learning, others to trades, according to their genius. Their habit is cloth, and half of them wear blue and half red, with a black bonnet. There is also a school for poor girls, to the number of 120, clothed with red or blue. In short, there is no place in the Low Countries where they take more care of widows and orphans.

It is remarkable that the knights of the golden fleece were instituted in this city in 1430, when the marriage of Philip the Good was celebrated with Elizabeth princess of Portugal. The parts about the city, which belong to it, are called *Franc of Bruges*, and contain 37 villages, and enjoy perfect liberty, according to the tenor of their freedom. The fortifications of Bruges are but trifling, inasmuch that in the time of war they always yield to the strongest party. It is eight miles east of Ostend, 24 north-east of Ghent, and 46 west of Antwerp. E. Long. 3. 5. N. Lat. 51. 11.

BRUGES (John of), (real name, John van Eick), a celebrated Flemish painter, and the first who discovered the method of painting in oil, flourished in the 15th century. He found in the course of his chemical experiments (to which science he also applied himself), that, by grinding colours with linseed or nut-oil, he could form them into a solid body which would resist the water, and not need the varnish used in painting in water-colours or in fresco. He presented the first picture painted in this manner to Alphonso I. king of Naples, who was much pleased with it.

BRUIN (John de), professor of natural philosophy and mathematics at Utrecht, was born at Gorcum in 1620. He had uncommon skill in dissecting animals, and was a great lover of experiments. He made also observations in astronomy. He published dissertations *De vi aëtrici*; *De corporum gravitate et levitate*; *De cognitione Dei naturali*; *De lucis causa et origine*, &c. He had a dispute with Isaac Vossius, to whom he wrote a letter printed at Amsterdam in 1663; wherein he criticises Vossius's book *De natura et proprietate lucis*; and strenuously maintains the hypothesis of Descartes. He died in 1675, after he had been professor 23 years: and his funeral oration was pronounced four days after by M. Grevins.

BRUISE, in surgery, the same with CONTUSION.

BRUMALES PLANTÆ, in botany, (from *bruma* winter); plants which flower in our winter: common about the Cape.

BRUMALIA, in Roman antiquity, festivals of Bacchus celebrated twice a-year; the first on the 12th

of the kalends of March, and the other on the 18th of the kalends of November. They were instituted by Romulus, who during these feasts used to entertain the senate. Among other heathen festivals which the primitive Christians were much inclined to observe, Tertullian mentions the *brumæ* or *brumalia*.

BRUMOY (Peter), a learned Jesuit born at Rouen in 1668, distinguished himself in his youth by his talents for the belles lettres; and during his whole life was beloved for his probity, his virtue, and the goodness of his heart. He wrote many works, the most considerable of which is his *Theatre of the Greeks*. He died at Paris in 1742.

BRUN (Anthony le), an ambassador of Spain, famous for his skill in negotiating, was of an ancient and noble family, and born at Dole in the year 1600. He was attorney-general in the parliament of Dole; during which time he had a hand in all the state negotiations which concerned the provinces. He was sent afterwards by Philip IV. to the diet of Ratisbon, and from thence to the court of the emperor Ferdinand III. He was one of the plenipotentiaries of his Catholic majesty, at the conferences of Munster held in 1643; where, though all the other plenipotentiaries took place of him, yet it is said that he far exceeded them all in capacity. The king of Spain was particularly beholden to him for the peace which the Dutch made at Munster, exclusively of France; and the intriguing turn which he showed upon this occasion made him dreaded ever after by French ambassadors. He was a man of letters, as well as of politics; and therefore employed his pen as well as his tongue in the service of his master. He died at the Hague, during his embassy, in the year 1654.

BRUN (Charles le), was descended of a family of distinction in Scotland, and born in the year 1619. His father was a statuary by profession. He discovered, it is said, such an early inclination for painting, that at three years of age he used to take coals, and design on the hearth and sides of the chimney, only by the light of the fire; and at 12 he drew the picture of his uncle so well, that it still passes for a fine piece. His father being employed in the gardens at Sequier, and having brought his son along with him, the chancellor of that name took a liking to him, and placed him with Simon Vouet, an eminent painter. He was afterwards sent to Fountainbleau, to take off some of Raphael's pieces. He sent him next to Italy, and supported him there for six years. Le Brun, in his return, met with the celebrated Poussin, by whose conversation he greatly improved himself in his art, and contracted a friendship with him which lasted as long as their lives. A painting of St Stephen, which he finished in 1651, raised his reputation to the highest pitch. Soon after this, the king, upon the representation of Mr Colbert, made him his first painter, and conferred on him the order of St Michael. His majesty employed two hours every day to see him work, while he was painting the family of Darius at Fountainbleau. About the year 1662, he began his five large pieces of the history of Alexander the Great, in which he is said to have set the actions of that famous conqueror in a more glorious light than Quintus Curtius hath done in his history. He procured several advantages for the royal academy of painting and sculpture at Paris, and formed the plan

Brumoy
Brou.

of another for the students of his own nation at Rome. There was scarce any thing done for the advancement of the fine arts in which he was not consulted. It was thro' the interest of M. Colbert that the king gave him the direction of all his works, particularly of his royal manufactory at the Gobelins, where he had a handsome house with a genteel salary assigned to him. He was also made director and chancellor of the royal academy, and showed the greatest zeal to encourage the fine arts in France. He was endowed with a vast inventive genius, which extended itself to arts of every kind. He was well acquainted with the manners and history of all nations. Besides his extraordinary talents, his behaviour was so genteel, and his address so pleasing, that he attracted the regard and affection of the whole court of France, where, by the places and pensions conferred on him by the king's liberality, he made a very considerable figure. Le Brun was the author of two treatises; one on physiognomy, and the other on the different characters of the passions. He died at Paris in 1690.

The talent of this painter, except for landscapes, was universal. He was not indeed admired for his colouring, nor for his skill in the distribution of his lights and shadows; but for a good gullo of design, an excellent choice of attitudes, an agreeable management of his draperies, a beautiful and just expression, and a strict observance of decorum. In fine, his compositions demand the attention and admiration of the nicest judges. The pieces that gained him greatest reputation were, besides what we have already mentioned, those which he finished at Fontainebleau, the great stair-case at Versailles, but especially the grand gallery there, which was the last of his works, and is said to have taken him up 14 years.

BRUNDISIUM, or BRUNDISIUM, (anc. geog.), a town of Calabria, with the best harbour in Italy. It was a very ancient town, and belonged originally to the Salentines; but was taken by the Romans about 256 years before Christ. Now *Brindisi*; which see.

BRUNIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The flowers are aggregate or clustered; the filaments inserted into the heels of the petals; the stigma is bifid; the seeds are solitary, and the capsule is bilocular. There are eight species.

BRUNO (Jordano), an atheistical writer, was born at Nolo in the kingdom of Naples; and about the year 1582 began to call in question some of the tenets of the Romish church, which occasioned his retiring to Geneva: but after two years stay there, he expressed his aversion to Calvinism in such a manner that he was expelled the city. After having staid some time at Lyons, Thoulouse, and Paris, he came to London, and continued two years in the house of Mr Castlneau the French ambassador. He was very well received by queen Elizabeth and the politer part of the court. His principal friends were Sir Philip Sidney and Sir Fulk Greville. With these and some others of their club, Bruno held assemblies; but as they treated of subjects of a very delicate nature, which could not suit the taste or capacity of every body, they kept the door always shut, and none but select persons were admitted into their company. At Sir Philip's request, he composed his *Spaccio della Bestia Trionfante*, which was

printed in 8vo, 1584, and dedicated to that gentleman. This work, which is remarkable for nothing but its impiety, we are told in one of the Spectators, (n. 389), sold at an auction in London for L. 50. From England he went to Wittenberg, and from thence to Praga, where he printed some tracts, in which he openly discovered his atheistical principles. After visiting some other towns in Germany, he made a tour to Venice. Here he was apprehended by order of the inquisition; tried; condemned; and refusing to retract, was burnt at the stake, February 9th 1600.

BRUNSBUTTLE, a sea port-town of Germany, in the circle of Lower Saxony, and duchy of Holstein, seated at the mouth of the river Elbe, in E. Long. 8. 42. N. Lat. 44. 30. It is subject to Denmark.

BRUNSFELSLIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. The corolla is funnel-shaped, and very long; and the fruit an unilocular polyspermous berry. There is but one species, *viz.* the americana. It rises with a woody branching rough stem six or eight feet high; garnished with oblong entire leaves on footstalks, and large whitish flowers by threes or fours at the ends of the branches, succeeded by round saffron-coloured soft fruit. This plant may be raised from seeds sown in pots in the spring, and plunged in a bark-bed. It may also be propagated by cuttings planted in pots in the same season, plunging them also in a bark-bed or other hot-bed under glasses. The plants must always remain in the stove.

BRUNSWICK, a city of Germany, in the circle of Lower Saxony, and capital of the duchy of the same name. It is composed of five towns, *viz.* the Old Town, the New Town, the Hagen or Burg, the Old Wiek, and the Sac, which makes it a large place, but the houses are almost all built of wood. There are several churches, one of which is an ancient Gothic building, but the appearance of its antiquity is almost absorbed by the repairs it has undergone. Brunswick is a fortified place, and would require a numerous army to besiege, and not a few men to defend it. It is of a square form, divided in the middle by the river Ocker. It is about two miles in circumference, and is strongly fortified. On the ramparts is a mortar-piece of brass, ten feet six inches long, and nine feet two inches in circumference, weighing 1800 quintals, and has 93 quintals of iron in its carriages. It will carry a ball of 730 pounds weight to the distance of 33,000 paces, and throw a bomb of a thousand weight; but it requires 52 pounds of powder for a charge. This city is the residence of the prince whom we style the *Duke of Brunswick Wolfenbuttle*. The inhabitants of the city and parts adjacent carry on a considerable trade with Bohemia. Brunswick mum is well known in England; a small sort of which is the common drink of the inhabitants of the city. The religion here is the Lutheran, and they observe it very strictly. The peasants are sober and laborious, but clownish and heavy; however, as they are robust and strong, they make good soldiers. The elector of Hanover is styled *Duke of Brunswick*, though he has no property in, nor dominion over, this city, which belongs to the duke of Brunswick Wolfenbuttle. The number of inhabitants is about 24,000; and the whole income of the duke is estimated at L. 130,000. The academy of Brunswick,

Brunswick Dr Moore informs us, has been new-modelled, and the plan of education improved, by the attention, and under the patronage, of the hereditary prince. Students now resort to this academy from many parts of Germany; and there are generally some young gentlemen from Britain, who are sent to be educated here. Such of them as are intended for a military life, will not find so many advantages united at any other place in the continent, as at the academy of Brunswick. They will here be under the protection of a family partial to the British nation;—every branch of science is taught by masters of known abilities;—the young students will see garrison duty regularly performed, and may by the interest of the prince obtain liberty to attend the reviews of the Prussian troops at Magdeburg and Berlin. They will have few temptations to expence, in a town where they can see no examples of extravagance—have few opportunities of dissipation, and none of gross debauchery.

The fortifications at Brunswick were of great utility last war, and on one occasion they saved the town from being pillaged, and afforded prince Frederick, who is now in the Prussian service, an opportunity of performing an action, which, it is imagined, gave him more joy than twenty victories. This happened in the year 1761, soon after the battle of Kirch Denker, when duke Ferdinand protected Hanover, not by conducting his army into that country, and defending it directly, as the enemy seemed to expect, and probably wished; but by diversion, attacking with strong detachments, commanded by the hereditary prince, their magazines in Hesse, and thus drawing their attention from Hanover to that quarter. While the duke lay encamped at Willhemsthal, watching the motions of Broglie's army, the marshal being greatly superior in numbers, sent a body of 20,000 men, under prince Xavier of Saxony, who took possession of Wolfenbuttle, and soon after invested Brunswick. Prince Ferdinand, anxious to save his native city, ventured to detach 5000 of his army, small as it was, under his nephew Frederick, assisted by general Luckener, with orders to harass the enemy, and endeavour to raise the siege. The young prince, while on his march, sent a soldier with a letter to the governor, which was wrapped round a bullet, and which the soldier was to swallow in case of his being taken by the enemy.—He had the good fortune to get safe into the town. The letter apprised the commander of the garrison of the prince's approach, and particularised the night and hour when he expected to be at a certain place near the town, requiring him to favour his entrance.

In the middle of the night appointed, the prince fell suddenly on the enemy's cavalry, who, unsuspecting of his approach, were encamped carelessly within a mile of the town. They were immediately dispersed, and forced such an alarm among the infantry, that they also retreated with considerable loss. Early in the morning the young prince entered Brunswick, amidst the acclamations of his fellow-citizens, whom he had relieved from the horrors of a siege. The hereditary prince having destroyed the French magazines in Hesse, had been recalled by his uncle, and ordered to attempt the relief of Brunswick. While he was advancing with all possible speed, and had got within a few leagues

of the town, he received the news of the siege being raised. On his arrival at his father's palace, he found his brother Frederick at table, entertaining the French officers, who had been taken prisoners the preceding night.

BRUNSWICK (the duchy of), is a country of Germany, bounded on the north by the duchy of Lunenburg; on the west, by the circle of Westphalia, from which it is separated by the river Weser; on the south by Hesse, and the little territory of Piechfeld; and on the east by Thuringia, with the principalities of Anhalt and Halberstadt, and the duchy of Magdeburg. The rivers are, the Weser, the Ocker, and the Lyne; and it is fertile both in corn and pastures. It is divided into three principalities, Wolfenbuttle, Grubenhagen, and Calenberg, which also comprehends the duchy of Gottingen. The principality of Wolfenbuttle has its own dukes; but the other two belong to the elector of Hanover. The territories of the house of Brunswick are more extensive; the principal of which are the duchies of Brunswick and Lunenburg, with the county of Danneburg, which is annexed thereto. The rest are Blankenburg, Dieport, and Hoyer, besides two or three smaller districts.

BRUNSWICK (the family of). The illustrious and ancient house of Brunswick owes its origin to Azo IV. of the family of Este, son of Hugo III. marquis of Ferrara in Italy. Azo, who died in 1055, left by his wife Cunegonde, daughter and heiress to Guelph III. Duke of Bavaria, a son, who was Guelph IV. great-grandfather to Henry the Lion. His son, Guelph V. surnamed the Valiant, was created duke of Bavaria by the Emperor Henry II. His son, Guelph VI. married Matilda, the richest heiress in Europe; but having no issue, his brother Henry the Black succeeded to his dominions. He died in 1125, having married Wulfhild daughter of Magnus, last duke of Saxony, of the Bulling family, by whom he had Henry the Proud, who succeeded to Bavaria in 1137; and he having married a daughter of the emperor Lotharius, his father-in-law granted him investiture of Saxony, and meant him for his successor in the empire; but this last he was disappointed of. Dying in 1139, both Saxony and Bavaria devolved on his son Henry V. surnamed the Lion. He married Maude, eldest daughter of king Henry II. of England, and is always looked upon as the founder of the Brunswick family: it is therefore extremely remarkable, that his present Majesty should be descended from one of our worthiest monarchs, in whom were united the royal Anglo-Saxon and Norman blood. The dominions possessed by Henry the Lion were the most extensive of any prince of his time; but having refused to assist the emperor Frederick Barbarossa in a war against Pope Alexander III. this drew the emperor's resentment on him; and being already jealous of his power and abilities, all his former services were forgotten; and, in the diet of Wurtzburg in 1179 or 1180, he was proscribed. The duchy of Bavaria was given to Otho count Wittelpach, from whom is descended the present electoral family of Bavaria; the duchy of Saxony to Bernard Ascanius, founder of the house of Anhalt; and all his other territories disposed of to different persons. On this he retired to England; and, by his father's intercession,

Brundisland Brunswick and Lunenburg were restored to him. His wife Maude died in 1189, and he in 1195. He left three sons; but the two oldest not leaving any male issue, William, the third son, carried on the line of the family: and his son Otto was created duke of Brunswick and Lunenburg in 1235, by the emperor Ferdinand II. From him all the succeeding dukes of this family have descended; and no family can boast of a line of princes who have more distinguished themselves, both by their political abilities and martial achievements; and they are allied to all the principal families in Europe. The house of Brunswick has divided into several branches. The present duke of Brunswick-Wolfenbittel is sprung from the eldest; the duke of Brunswick-Zell was from the second; and from this last sprung the elector of Hanover.

BRUNTISLAND, a parliament-town of Fifeshire in Scotland, situated on the frith of Forth, eight miles north of Edinburgh, in W. Long. 3. 5. N. Lat. 56. 12. Here is the best harbour on the coast, formed by a rocky isle ckd out with piers, for there are none on this side the county entirely natural. This is dry at low water. The church is square, with a steeple rising in the centre. The old castle, built by the *Darries*, commanded both town and harbour. The place has a natural strength, which, with the conveniency of a port opposite to the capital, made it, during the troubles of 1560, a most desirable post. The French, allies of the queen regent, fortified it strongly. In 1715, it was surpris'd and possessed by the rebels, who here formed the bold design of passing over a body of troops to the opposite shore; which was in part executed, under the command of brigadier Macintosh, notwithstanding all the efforts of the men of war.

BRUSCHIUS (Gaspar), a Latin historian and poet, was born at Egra in Bohemia, in 1518. He was devoted to books from his childhood, and especially to poetry, in which he gained so much reputation, that he attained to the poetical crown, to the dignity of poet laureat, and of count palatine. He wrote with prodigious facility; and his verses are extremely flowing, easy, and natural. He published Latin poems on a great variety of subjects; the history of the bishops and bishops of Germany; history of German monasteries; and a great number of other works, of which a catalogue is given in Gesner's *Bibliothèque*. Bruschius was far from being rich, or rather he was very poor; subsisting almost entirely by the benefactions of his poetical patrons, and by presents from the abbots and abbesses whose monasteries he described. The liberalities of some abbots, while he was with Oporin at Basil, enabled him to buy a new suit of clothes; but when he found, that appearing well dressed in the streets procured him many marks of respect from the vulgar, he tore his new suncy to pieces, "as slaves that had usurped their master's honours." Bruschius seems to have been too great a philosopher for the age he lived in, or indeed for any age. He was murdered in the forest of Sealingenbach, between Rottenberg on the Tauber and Wimpheim: and it was believed that this assassination was concerted and carried into execution by some gentlemen against whom Bruschius was about to write something.

BRUSH, an assemblage of hairs or hogs bristles fastened in the holes of a wooden laudle or board,

pierced for that purpose, serving to cleanse divers bodies by rubbing therewith. The manner of making brushes is by folding the hair or bristle in two; and bringing it by means of a packthead, which is engaged in the fold, through the holes with which the wood is pierced all over, being afterwards fastened therein with glue. When the holes are thus filled, the ends of the hair are cut to make the surface even.

Shearers Brush, is made of wild bears bristles; and serves to lay the wool or nap of cloth, after shearing it for the last time.

BRUSH, among painters, a larger and coarser kind of a pencil made of hogs bristles, wherewith to lay the colours on their large pieces. The Chinese painters brush consists of the stalk of a plant; whose fibres being fretted at both ends, and tied again, serve for a brush.

Wire-Brushes, are used by silver smiths and gilders, for scrubbing silver, copper, or brass pieces, in order to the gilding of them. There is a method of dying or colouring leather, performed by only rubbing the colour on the skin with a brush. This the French leather-gilders call *brassure*; being the lowest of all the sorts of dye allowed by their statutes.

BRUSH of a Fox, among sportsmen, signifies his drag or tail, the tip or end of which is called the *chape*.

BRUSH is also used in speaking of a small thicket or coppice. In this sense the word is formed from the middle-age Latin *bruscia*, *bruscus*, which signifies the same.

Brush-Wood denotes small slender wood or spray. See **BROWSE**.

BRUSH, in electricity, denotes the luminous appearance of the electric matter issuing in a parcel of diverging rays from a point. Beccaria ascribes this appearance to the force with which the electric fluid, going out of a point, divides the contiguous air, and passes through it to that which is more remote.

BRUSHING. Among jockies, a brushing gallop denotes a brisk one: a horse should have his brushing gallop in a morning before watering.

BRUSSELS, the capital of Brabant in the Austrian Netherlands, and generally the seat of the Austrian governor, is situated on the small river Senne, which runs through it. It is a rich and handsome city; and among the public structures, the ducal palace where the governor resides, the town house, and the arsenal, are most superb. No city in Europe, except Naples and Genoa, makes a finer appearance at a distance: but, like them, when in the town, it is all up and down hill. It is encompassed with a double brick wall, and has seven gates; but being seven miles in compass, is too large to hold out a long siege. In Brussels are seven fine squares or market-places; that of the great market is one of the most beautiful in the world. The town-house takes up one quarter of it; and has a very high steeple, on the top of which is a brazen statue of St Michael, fifteen feet high. In one of the apartments, which is handsomely adorned, the states of Brabant meet. In three other rooms there is the history of the resignation of Charles V. wrought in tapestry; which is so well done, that it may be mistaken for painting. In the other parts of this square, are the halls of the different trades. There are here several palaces of the nobility: that of Orange now belongs to the king of Prussia.

Brussels. Prussia. The opera-house is built after the Italian manner, with rows of boxes, in which are chimneys. One is covered over with looking-glass, so that they can sit by the fire, drink a bottle, and see what is doing. There are 20 public fountains, adorned with statues, at the corners of the most public streets; and in the middle of the town-house is one with Neptune, the tritons, and the horses spouting out water from their nostrils. The hospitals are well endowed, some of which are for the maintenance of strangers for three days. There is also a sundling hospital, and one for penitent courtesans. Among the churches, that of St Gudula is very magnificent. It stands on the top of a hill, near the gate of Louvain, and is surrounded with iron balustrades. It is an old Gothic structure, with two large steeples at the east end, and is finely adorned within. The Jesuits have a fine church as well as a library. There are several monasteries and nunneries, two of which are English. The nunnery called the *Berguigne* is like a little town, being surrounded by a wall and ditch, and has little streets, where each nun has an apartment. Six or seven hundred girls are educated here.

In 1695, Brussels was bombarded by marshall Villeroy, who demolished four thousand houses, the stadt-houze, and several churches. In 1708, it was besieged again by the elector of Bavaria; but the duke of Marlborough soon came to its assistance, and obliged him to raise the siege with precipitation. Marshal Saxe, the French general, took it in 1746; but it was restored by the treaty of Aix la Chapelle. It is much fallen from its former splendor; and all the trade which is carried on there is in lace, camblets, and tapestry, which they make in great perfection. E. Long. 4. 8. N. Lat. 50. 54.

BRUSSELS (the quarter or district of), is one of the four parts of the duchy of Brabant. This quarter is bounded on the east by that of Louvain; on the north by that of Antwerp; on the west by Flanders; and on the south by Hainhalt. Brussels is the capital city of this quarter and all Brabant.

BRUTE, a general name for all animals except mankind.

Among brutes, the monkey kind bear the nearest resemblance to man; both in the external shape and internal structure, but more in the former than in the latter. In the monkey kind, the highest and the nearest approach to the likeness of man is the Oran Outang, or *Homo Sylvestris* †.—The structure and economy of brutes make the objects of what is called *Comparative Anatomy*. See that article.

Philosophers have been much puzzled about the essential characteristics of brutes, by which they may be distinguished from man. Some define a brute to be an *animal not visible*, or a *living creature incapable of laughter*; others call them *mute animals*. The peripatetics allowed them a sensitive power, but denied them a rational one. The Platonists allowed them reason and understanding, though in a degree less pure and refined than that of men. Lactantius allows every thing to brutes which men have, except a sense of religion; and even this has been ascribed to them by some sceptics. Descartes maintained that brutes are mere inanimate machines, absolutely destitute not only of reason, but of all thought and perception, and that all their ac-

tions are only consequences of the exquisite mechanism of their bodies. This system, however, is much older than Descartes; it was borrowed by him from Gomez Pereira, a Spanish physician, who employed 30 years in composing a treatise which he entitled *Antoniana Margarita*, from the Christian names of his father and mother. It was published in 1554; but his opinion had not the honour of gaining partizans, or even of being refuted; so that it died with him. Even Pereira seems not to have been the inventor of this notion; something like it having been held by some of the ancients, as we find from Plutarch and St Augustin. Others, who rejected the Cartesian hypothesis, have maintained that brutes are endowed with a soul essentially inferior to that of men; and to this soul some have allowed immortality, others not. And, lastly, in a treatise published by one Bougeant a Jesuit, entitled *A philosophical amusement on the language of beasts*, he affirms that they are animated by evil-spirits or devils.

The opinion of Descartes was probably invented, or at least adopted, by him to defeat two great objections: one against the immortality of the souls of brutes, if they were allowed to have any; the other against the goodness of God, in suffering creatures who had never sinned, to be subjected to so many miseries. The arguments in favour of it may be stated as follow: 1. It is certain, that a number of human actions are merely mechanical; because they are done imperceptibly to the agent, and without any direction from the will; which are to be ascribed to the impression of objects and the primordial disposition of the machine, wherein the influence of the soul has no share; of which number are all habits of the body acquired from the reiteration of certain actions. In all such circumstances, human beings are no better than automata. 2. There are some natural movements so involuntary, that we cannot restrain them; for example, that admirable mechanism ever on the watch to preserve an equilibrium, when we stoop, bend, or incline our bodies in any way, and when we walk upon a narrow plank. 3. The natural liking for, and antipathy against, certain objects, which in children precede the power of knowing and discriminating them, and which sometimes in grown persons triumph over all the efforts of reason; are all phenomena to be accounted for from the wonderful mechanism of the body, and are so many cogent proofs of that irresistible influence which objects have on the human frame. 4. Every one knows how much our passions depend on the degree of motion into which the blood is put, and the reciprocal impressions caused by the animal-spirits between the heart and brain, that are so closely connected by their nerves; and if such effects may be produced by such simple mechanical means as the mere increase of motion in the blood, without any direction of the will, we are not to wonder at the actions of brutes being the effects only of a refined mechanism, without thought or perception. 5. A farther proof will arise from a consideration of the many wonderful effects which even the ingenuity of men has contrived to bring about by mechanical means; the androide, for instance, of Mr Kempell, which plays at chess. Now, it is not to be questioned, but that the mechanism of the body of the meanest animal infinitely

Brussels.
Brute

Brute.

† See *Simia*.

Brute. finitely surpasses that of Mr Kempell's machine; and what can be the consequence of this, but that the actions of that animal must be proportionably more surpassing than those of the wooden chess-player? See **ANDROIDES and AUTOMATON.**

The above is a short abstract of all the arguments that are brought in favour of the Cartesian system: but they are evidently very far from being conclusive. They are deficient, in the first place, because, though we allow them in the utmost extent the Cartesians themselves can desire, they prove only the possibility of brutes being inanimate, and that the power of God actually could produce such and such actions from inanimate machines; but that he actually hath done so, they have not the least tendency to prove. In the second place, the Cartesian argument is insufficient, because it hath no limits, and knows not where to stop; as, by the same method of arguing, every man might prove his neighbour to be an inanimate machine: for though every individual be conscious of his own thoughts, he is not so of those of his neighbours; and it no more exceeds the power of God to cause an inanimate machine perform the actions of a man than those of a beast. Neither are the two objections which the hypothesis is calculated to answer, to be at all admitted as arguments in its favour. They are, 1. That if we allow brutes to have souls, they must be immaterial, and consequently immortal; and, 2. It seems a contradiction to the goodness of God to think that he should subject innocent creatures to such a multitude of evils as we see the brute creation endure in this world. The first of these is productive of no bad consequences to us, though it should be granted: and if it is supposed that the brute creatures are really immortal, the second objection vanishes; because, in the enjoyment of endless felicity, all temporary afflictions, how severe soever, must be swallowed up as though they had never been.

As to a positive proof on the other side, *viz.* that brutes are really endowed with sensation and consciousness, there is undoubtedly the same evidence for the sensibility of brutes that there is for that of mankind. We see brutes avoid pain as much as we do; and we likewise see them seek for pleasure and express their happiness in the enjoyment of certain things by signs not at all equivocal. Therefore, though we grant the possibility of all this being the effect of mere mechanism; yet, as we are conscious that in ourselves similar effects are produced by a sentient principle, we have all the reason in the world to conclude that in brutes they are likewise derived from a principle of sensation: especially seeing we know of no kind of mechanism in any other part of nature that produces any thing like the effects just mentioned; and until we see that a mechanism of this kind does take place in some part of nature, we have no right to suppose it in any. As to those actions of the human body in which it seems to move spontaneously, like an automaton, without the direction of the mind or will, it is almost superfluous to observe, that they were not performed in this manner originally, but required very great exertions of the will and intellectual faculty before the body could be brought to perform them easily; so that from this nothing can be inferred. Add to this, that divine revelation sets forth to us in many

Brute. places the brute creation as objects of mercy; which could not be done without the highest absurdity, if they were not really capable of feeling pleasure and pain as well as we.

The most rational opposers of the Cartesian scheme maintain, that brutes are endowed with a principle of sensation as well as we; though of an inferior nature to ours. Great disputes, however, have arisen on this subject; some maintaining, that the soul of brutes is merely sensitive, and that they are altogether destitute of reflection and understanding; others, that they not only reason, but make a better use of it than men do. That the brutes are endowed only with sensation, and totally destitute of all power of reflection, or even reasoning, is what can by no means be maintained on good grounds: neither can it be asserted that they act entirely from instinct, or a blind propensity to certain things without knowing why or wherefore. In numberless instances, needless to be mentioned here, but which will readily occur to every reader, it is evident, that education will get the better of many of the natural instincts of brutes; which could never be the case were they absolutely incapable of reasoning. On the other hand, it is equally certain, that they are by no means capable of education in the same degree that men are; neither are the rational exertions of beasts at all to be compared even with those of the meanest savages. One remarkable instance of this is in the use of the element of fire. The most savage nations have known how to make this element subservient to their purposes; or if some have been found who have been entirely ignorant of its existence, they have quickly learned its uses on seeing it made use of by others; but though many of the brute creatures are delighted with warmth, and have opportunities every day of seeing how fire is supplied with fuel, and by that means preserved, it never was known that one of them attempted to preserve a fire by this means. This shows a strange defect of rationality, unaccountable upon any other supposition than that the soul or sentient principle of brutes is some how or other inferior in its nature to that of man; but still it is a sentient principle, capable of perceptions as quick, and in many instances much more so than our own.

Father Bougeant supports his opinion of the spirits of brute creatures being devils, in the following manner: Having proved at large that beasts naturally have understanding, "Reason (says he) naturally inclines us to believe that beasts have a spiritual soul; and the only thing that opposes this sentiment is, the consequences that might be inferred from it. If brutes have a soul, that soul must be either matter or spirit; it must be one of the two, and yet you dare affirm neither. You dare not say it is matter, because you must then necessarily suppose matter to be capable of thinking: nor will you say that it is spirit, this opinion bringing with it consequences contrary to the principles of religion; and this, among others, that man would differ from beasts only by the degrees of plus and minus; which would demolish the very foundation of all religion. Therefore, if I can evade all these consequences; if I can assign to beasts a spiritual soul, without striking at the doctrines of religion; it is evident, that my system, being moreover the most agreeable to reason,

Brute.

is the only warrantable hypothesis. Now I shall, and can do it, with the greatest ease imaginable. I even have means, by the same method, to explain many very obscure passages in the Holy Scripture, and to resolve some very great difficulties which are not well confuted. This we shall unfold in a more particular manner.

“ Religion teaches us, that the devils, from the very moment they had sinned, were reprobate, and that they were doomed to burn for ever in hell; but the church has not yet determined whether they do actually endure the torments to which they are condemned. It may then be thought that they do not yet suffer them, and that the execution of the verdict brought against them is reserved for the day of the final judgment.—Now what I pretend to infer from hence is, that, till doomsday comes, God, in order not to suffer so many legions of reprobate spirits to be of no use, has distributed them through the several spaces of the world, to serve the designs of his Providence, and make his omnipotence to appear. Some, continuing in their natural state, busy themselves in tempting men, in seducing and tormenting them; either immediately, as Job’s devil, and those that lay hold of human bodies; or by the ministry of forcerers or phantoms. These wicked spirits are those whom the scripture calls the *powers of darkness*, or the *powers of the air*. God, with the others, makes millions of beasts of all kinds, which serve for the uses of men, which fill the universe, and cause the wisdom and omnipotence of the Creator to be admired. By that means I can easily conceive, on the one hand, how the devils can tempt us; and on the other, how beasts can think, know, have sentiments, and a spiritual soul, without any way striking at the doctrines of religion. I am no longer surpris’d to see them have forecall, memory, and judgment. I should rather have occasion to wonder at their having no more, since their soul very likely is more perfect than ours. But I discover the reason of this: it is because, in beasts as well as in ourselves, the operations of the mind are dependent on the material organs of the machine to which it is united; and those organs being grosser and less perfect than in us, it follows, that the knowledge, the thoughts, and the other spiritual operations of the beasts, must of course be less perfect than ours: And if these proud spirits know their own dismal state, what an humiliation must it be to them thus to see themselves reduced to the condition of beasts! But, whether they know it or no, so shameful a degradation is still, with regard to them, the primary effect of the divine vengeance I just mentioned; it is an anticipated Hell.”

Having mentioned the prejudices against this hypothesis, such particularly as the pleasure which people of sense and religion take in beasts and birds, especially all sorts of domestic animals; he proceeds, “ Do we love beasts for their own sakes? No. As they are altogether strangers to human society, they can have no other appointment but that of being useful and amusing. And what care we whether it be a devil or any other creature that amuses us? The thought of it, far from shocking, pleases me mightily. I with gratitude admire the goodness of the Creator, who gave me so many little devils to serve and amuse me.

Brute.

If I am told that these poor devils are doomed to suffer eternal tortures, I admire God’s decrees, but I have no manner of share in that dreadful sentence; I leave the execution of it to the sovereign Judge; and, notwithstanding this, I live with my little devils as I do with a multitude of people, of whom religion informs me that a great number shall be damned. But the cure of a prejudice is not to be effected in a moment; it is done by time and reflection: give me leave then lightly to touch upon this difficulty, in order to observe a very important thing to you.

“ Persuaded as we are that beasts have intelligence, have we not all of us a thousand times pitied them for the excessive evils which the majority of them are exposed to, and in reality suffer? How unhappy is the condition of horses! we are apt to say upon seeing a horse whom an unmerciful carman is murdering with blows. How miserable is a dog whom they are breaking for hunting! How dismal is the fate of beasts living in woods! they are perpetually exposed to the injuries of the weather; always seized with apprehensions of becoming the prey of hunters, or of some wilder animal; for ever obliged, after long fatigue, to look out for some poor insipid food; often suffering cruel hunger; and subject, moreover, to illness and death! If men are subject to a multitude of miseries that overwhelm them, religion acquaints us with the reason of it; viz. the being born sinners. But what crimes can beasts have committed by birth to be subject to evils so very cruel? What are we, then, to think of the horrible excesses of miseries undergone by beasts? miseries, indeed, far greater than those endured by men. This is, in any other system, an incomprehensible mystery; whereas nothing is more easy to be conceived from the system I propose. The rebellious spirits deserve a punishment still more rigorous, and happy it is for them that their punishment is deferred. In a word, God’s goodness is vindicated, man himself is justified: for what right can we have, without necessity, and often in the way of mere diversion, to take away the life of millions of beasts, if God had not authorized us so to do? And beasts being as sensible as ourselves of pain and death, how could a just and merciful God have given man that privilege, if they were not so many guilty victims of the divine vengeance?”

“ But hear still something more convincing, and of greater consequence: beasts, by nature, are extremely vicious. We know well that they never sin, because they are not free; but this is the only condition wanting to make them sinners. The voracious birds and beasts of prey are cruel. Many insects of one and the same species devour one another. Cats are perfidious and ungrateful; monkeys are mischievous; and dogs envious. All beasts in general are jealous and revengeful to excess; not to mention many other vices we observe in them: and at the same time that they are by nature so very vicious, they have, say we, neither the liberty nor any helps to resist the bias that hurries them into so many bad actions. They are, according to the schools, necessitated to do evil, to disconcert the general order, to commit whatever is most contrary to the notion we have of natural justice and to the principles of virtue. What monsters are these in a world originally created for order and justice to

reign in? This is, in good part, what formerly persuaded the Manicheans that there were of necessity two orders of things, one good, and the other bad; and that the beasts were not the work of the good principle: a monstrous error! But how then shall we believe that beasts came out of the hands of their Creator with qualities so very strange! If man is so very wicked and corrupt, it is because he has himself through sin perverted the happy nature God had given him at his creation. Of two things, then, we must say one: either that God has taken delight in making beasts so vicious as they are, and of giving us in them models of what is most shameful in the world; or that they have, like man, original sin, which has perverted their primitive nature.

“The first of these propositions finds very difficult access to the mind, and is an express contradiction to the holy scriptures; which say, that whatever came out of God’s hands, at the time of the creation of the world, was good, yea very good. What good can there be in a monkey’s being so very mischievous, a dog so full of envy, a cat so malicious? But then many authors have pretended that beasts, before man’s fall, were different from what they are now; and that it was in order to punish man that they became so wicked. But this opinion is a mere supposition of which there is not the least footsteps in Holy Scripture. It is a pitiful subterfuge to elude a real difficulty: this at most might be said of the beasts with whom man has a sort of correspondence; but not at all of the birds, fishes, and insects, which have no manner of relation to him. We must then have recourse to the second proposition. That the nature of beasts has, like that of man, been corrupted by some original sin: Another hypothesis, void of foundation, and equally inconsistent with reason and religion, in all the systems which have been hitherto espoused concerning the souls of beasts. What party are we to take? Why, admit of my system, and all is explained. The souls of beasts are refractory spirits which have made themselves guilty towards God. The sin in beasts is no original sin; it is a personal crime, which has corrupted and perverted their nature in its whole substance; hence all the vices and corruption we observe in them, though they can be no longer criminal, because God, by irrecoverably reprobating them, has at the same time divested them of their liberty.”

These quotations contain the strength of father Bougeant’s hypothesis, which also hath had its followers; but the reply to it is obvious. Beasts, though remarkably mischievous, are not completely so; they are in many instances capable of gratitude and love, which devils cannot possibly be. The very same passions that are in the brutes, exist in the human nature; and if we chose to argue from the existence of those passions, and the ascendancy they have over mankind at some times, we may say with as great justice, that the souls of men are devils, as that the souls of brutes are. All that can be reasonably inferred from the greater prevalence of the malignant passions among the brutes than among men, is, that the former have less rationality than men: and accordingly it is found, that among savages, who exercise their reason less than other men, every species of barbarity is practised, without being deemed a crime.

On the present subject there is a very ingenious treatise in German, published by the late professor Bergman, under the title (as translated) of “Researches designed to show what the brute animals certainly *are not*, and also what they probably *are*.”—That they are *not* machines, he proves with more detail than seemed necessary for refuting a hypothesis which would equally tend to make *us all* machines. It is certain, that the *half-raising* elephant cannot be deemed a machine, by us, from any other consideration, than that *he* goes upon four feet, while *we* go upon two; and he might as well take us for mere machines because *we* go upon two feet, while *he* goes upon four.

But if animals are not mere machines, what *are* they? Manifestly sensitive beings, with an immaterial principle; and thinking or reasoning beings, in a *certain degree*. In certain classes of animals this appears evident to our author, who seems to have observed with great sagacity and attention their *various* operations and proceedings, their ways and means, &c. He thinks it impossible to deduce this variety of action, in any animals (if we except those of the lowest classes in the gradation of intelligence), from a general and uniform instinct. For they accommodate their operations to times and circumstances. They combine; they choose the favourable moment; they avail themselves of the occasion, and seem to receive instruction by experience. Many of their operations announce reflection: the bird repairs a shattered nest, instead of constructing instinctively a new one: the hen, who has been robbed of her eggs, changes her place in order to lay the remainder with more security: the cat discovers both care and artifice in concealing her kittens. Again, it is evident, that, on many occasions, animals know their faults and mistakes, and correct them; they sometimes contrive the most ingenious methods of obtaining their ends, and when one method fails have recourse to another; and they have, without doubt, a kind of language for the mutual communication of their ideas. How is all this to be accounted for (says our author), unless we suppose them endowed with the powers of perceiving, thinking, remembering, comparing, and judging? They have these powers, indeed, in a degree inferior to that in which they are possessed by the human species, and form classes below them in the graduated scale of intelligent beings. But still it seems to our author unreasonable to exclude them from the place which the principles of sound philosophy, and facts ascertained by constant observation, assign to them in the great and diversified sphere of life, sensation, and intelligence;—he does not, however, consider them as beings whose actions are directed to *moral* ends, nor consequently as accountable and proper subjects for *reward or punishment* in a future world.

That brute animals possess affection and sentiment, and are susceptible of the kindly as well as the irascible passions, independently of sexual attachment and natural affection, is evident from the numerous instances of affection and gratitude duly observable in different animals, particularly the dog. Of those and other sentiments, such as pride, and even a sort of glory, the elephant exhibits proofs equally surprising and incontestable.

Brute. table, as the reader may see under the article ELEPHAS.

White's Natural History &c. of Sel. birds.

As to the natural affection of brutes, says an ingenious writer, "the more I reflect on it, the more I am astonished at its effects. Nor is the violence of this affection more wonderful than the shortness of its duration. Thus every hen is in her turn the virago of the yard in proportion to the helplessness of her brood; and will fly in the face of a dog or a sow in defence of those chickens which in a few weeks she will drive before her with relentless exactness. This affection sublimates the passions, quickens the invention, and sharpens the sagacity of the brute creation. Thus an hen, just become a mother, is no longer that placid bird she used to be, but with feathers standing on end, wings hovering, and clogging note, she runs about like one possessed. Dams will throw themselves in the way of the greatest danger in order to avert it from their progeny. Thus a partridge will tumble along before a sportsman in order to draw away the dogs from her helpless covey. In the time of nidification the most feeble birds will assault the most rapacious. All the hirundines of a village are up in arms at the sight of an hawk, whom they will persecute till he leaves that district. A very exact observer has often remarked, that a pair of ravens, nestling in the rock of Gibraltar would suffer no vulture or eagle to rest near their station, but would drive them from the hill with an amazing fury: even the blue thrush at the season of breeding would dart out from the clefts of the rocks to chase away the kestrel or the sparrow hawk. If you stand near the nest of a bird that has young, she will not be induced to betray them by an inadvertent fondness, but will wait about at a distance with meat in her mouth for an hour together. The flycatcher builds every year in the vines that grow on the walls of my house. A pair of these little birds had one year inadvertently placed their nest on a naked bough, perhaps in a shady time, not being aware of the inconvenience that followed: but an hot sunny season coming on before the brood was half fledged, the reflection of the wall became insupportable, and must inevitably have destroyed the tender young, had not affection suggested an expedient, and prompted the parent-birds to heave over the nest all the hotter hours, while with wings expanded and mouths gaping for breath they forewent off the heat for their suffering offspring. A farther instance I once saw of notable sagacity in a willow-wren, which had built in a bank in my fields. This bird a friend and myself had observed as she sat in her nest; but were particularly careful not to disturb her, though we saw she eyed us with some degree of jealousy. Some days after, as we passed that way, we were desirous of remarking how this brood went on; but no nest could be found, till I happened to take up a large bundle of long green moss as it were carelessly thrown over the nest, in order to dodge the eye of any impertinent intruder."

A wonderful spirit of sociality in the brute creation, independent of sexual attachment, has been frequently remarked. Many herds, though quiet with company, will not stay one minute in a field by themselves: the strongest fences cannot restrain them. A horse has been known to leap out at a stable window, through which dung was thrown, after company; and yet in other

respects is remarkably quiet. Oxen and cows will not fatten by themselves; but will neglect the finest pasture that is not recommended by society. It would be needless to instance in sheep, which constantly flock together. But this propensity seems not to be confined to animals of the same species. In the work last quoted, we are told of "a doe still alive, that was brought up from a little fawn with a dairy of cows; with them it goes a-field, and with them it returns to the yard. The dogs of the house take no notice of this deer, being used to her: but if strange dogs come by, a chase ensues; while the master smiles to see his favourite securely leading her pursuers over hedge, or gate, or stile, till she returns to the cows, who with fierce lowings and menacing horns drive the assailants quite out of the pasture."

Even great disparity of kind and size does not always prevent social advances and mutual fellowship. Of this the following remarkable instance is given in the same work: "A very intelligent and observant person has assured me, that in the former part of his life, keeping but one horse, he happened also on a time to have but one solitary hen. These two incongruous animals spent much of their time together in a lonely orchard, where they saw no creature but each other. By degrees an apparent regard began to take place between these two sequestered individuals. The fowl would approach the quadruped with notes of complacency, rubbing herself gently against his legs; while the horse would look down with satisfaction, and move with the greatest caution and circumspection, lest he should trample on his diminutive companion. Thus by mutual good offices each seemed to console the vacant hours of the other; so that Milton, when he puts the following sentiment in the mouth of Adam, seems to be somewhat mistaken:

Much less can bird with beast, or fish with fowl,
So well converse, nor with the ox the ape."

In the Gentleman's Magazine for March 1788 we have the following anecdotes of a raven, communicated by a correspondent who does not sign his name, but who says it is at the service of the doubtful. The raven alluded to "lives, or did live three years since, at the red lion at Hungerford; his name, I think, is *Rafe*. You must know then, that coming into that inn, my chaise run over or bruised the leg of my Newfoundland dog; and while we were examining the injury done to the dog's foot, *Rafe* was evidently a concerned spectator: for the minute the dog was tied up under the manger with my horse, *Rafe* not only visited but fetched him bones, and attended upon him with particular and repeated marks of kindness. The bird's notice of the dog was so marked, that I observed it to the hostler; for I had not heard a word before of the history of this benevolent creature. John then told me, that he had been bred from his pin-feather in intimacy with a dog; that the affection between them was mutual; and that all the neighbourhood had often been witnesses of the innumerable acts of kindness they had conferred upon each other. *Rafe*'s poor dog, after a while, unfortunately broke his leg; and during the long time he was confined, *Rafe* waited upon him constantly, carried him his provisions daily, and never scarce left him alone! One night by accident the hostler had shut

shut the stable door, and Rafe was deprived of the company of his friend the whole night; but the hottler found in the morning the bottom of the door so pecked away, that had it not been opened, Rafe would in another hour have made his own entrance-port. I then enquired of my landlady (a sensible woman), and heard what I have related confirmed by her, with several other singular traits of the kindnesses this bird shows to all dogs in general, but particularly to *maimed* or wounded ones. I hope and believe, however, the bird is still living; and the traveller will find I have not *over-rated* this wonderful bird's merit."

To these instances of attachment between incongruous animals from a spirit of sociality or the feelings of sympathy, may be added the following instance of fondness from a different motive, recounted by Mr White in the work already so frequently quoted. "My friend had a little helpless leveret brought to him, which the servants fed with milk in a spoon; and about the same time his cat kittened, and the young were dispatched and buried. The hare was soon lost, and supposed to be gone the way of most fondlings, to be killed by some dog or cat. However, in about a fortnight, as the master was sitting in his garden in the dusk of the evening, he observed his cat, with tail erect, trotting towards him, and calling with little short inward notes of complacency, such as they use towards their kittens, and something gambling after, which proved to be the leveret that the cat had supported with her milk, and continued to support with great affection. Thus was a graminivorous animal nurtured by a carnivorous and predaceous one!

"Why so cruel and sanguinary a beast as a cat, of the ferocious genus of *Felis*, the *murium les*, as Linnaeus calls it, should be affected with any tenderness towards an animal which is its natural prey, is not so easy to determine. This strange affection probably was occasioned by that desiderium, those tender maternal feelings, which the loss of her kittens had awakened in her breast; and by the complacency and ease she derived to herself from the procuring her teats to be drawn, which were too much dilated with milk, till from habit she became as much delighted with this foundling as if it had been her real offspring.

"This incident is no bad solution of that strange circumstance which grave historians as well as the poets assert, of exposed children being sometimes nurtured by female wild beasts that probably had lost their young. For it is not one whit more marvellous that Romulus and Remus, in their infant state, should be nursed by a she-wolf, than that a poor little sucking leveret should be fostered and cherished by a bloody grimalkin.

————— *Viridi satam Murtis in antro*
Procrubuisse lupam: genibus hinc ubera circum
Ludere pendentes parvos, et hinc ubi matrem
Impavidos: illam torsti cervice repositam
Mulere alteros, et corpora fingere lingua."

But besides the different qualities enumerated, besides reflection and sagacity often in an astonishing degree, and besides the sentiments and actions prompted by social or natural attachments, certain brutes seem on many occasions inspired with a superior faculty, a kind of presentiment or second-sight as it were, with regard to events and designs altogether unforeseen by

the rational beings whom they concern. Of the faculty alluded to, various instances will probably occur to our readers: We shall therefore only recite the following on account of its unquestionable authenticity. At the seat of the late earl of Lichfield, three miles from Blenheim, there is a portrait in the dining-room of Sir Henry Lee, by Johnston, with that of a mastiff dog which saved his life. It seems a servant had formed the design of assassinating his master and robbing the house; but the night he had fixed on, the dog, which had never been much noticed by Sir Henry, for the first time followed him up stairs, got under his bed, and could not be got from thence by either master or man: in the dead of night, the same servant entered the room to execute his horrid design; but was instantly seized by the dog, and being secured confessed his intentions. There are ten quaint lines in one corner of the picture, which conclude thus:

But in my dog, whereof I made no store,
 I find more love than those I trusted more.

Upon what hypothesis can we account for a degree of foresight and penetration such as this? Or will it be suggested, as a solution of the difficulty, that a dog may possibly become capable in great measure of understanding human discourse, and of reasoning and acting accordingly; and that, in the present instance, the villain had either uttered his design in soliloquy, or imparted it to an accomplice, in the hearing of the animal?

It has been much disputed whether the brutes have any language whereby they can express their minds to each other; or whether all the noise they make consists only of cries inarticulate, and unintelligible even to themselves. We are, however, too little acquainted with the intellectual faculties of these creatures to be able to determine this point. Certain it is, that their passions, when excited, are generally productive of some peculiar cry; but whether this be designed as an expression of the passion to others, or only a mechanical motion of the muscles of the larynx occasioned by the passion, is what we have no means of knowing. We may indeed, from analogy, conclude, with great reason, that some of the cries of beasts are really expressions of their sentiments; but whether one beast is capable of forming a design, and communicating that design by any kind of language to others, is what we submit to the judgment of the reader, after giving the following instance which among others is brought as a proof of it by father Bougeant. "A sparrow finding a nest that a martin had just built, standing very conveniently for him, possessed himself of it. The martin, seeing the usurper in her house, called for help to expel him. A thousand martins came full speed, and attacked the sparrow; but the latter being covered on every side, and presenting only his large beak at the entrance of the nest, was invulnerable, and made the boldest of them who durst approach him repent of their temerity. After a quarter of an hour's combat, all the martins disappeared. The sparrow thought he had got the better, and the spectators judged that the martins had abandoned their undertaking. Not in the least. Immediately they returned to the charge; and each of them having procured a little of that temper-

Bruti
||
Brutus.

earth with which they make their nests, they all at once fell upon the sparrow, and inclosed him in the nest to perish there, though they could not drive him thence. Can it be imagined that the martins could have been able to hatch and concert this design all of them together, without speaking to each other, or without some medium of communication equivalent to language?"

BRUTTI (anc. geog.), one of the two peninsulas of Italy, the ancient Calabria being the other; stretching to the south towards Sicily; bounded by the sea on every side except by the isthmus, between the river Laus and the Thurii, where it is terminated by Lucania; inhabited by the Bruttii, for whose country the ancient Romans had no peculiar name, calling both the people and the country indiscriminately *Bruttii*. This and a part of Lucania was the ancient Italia, (Stephanus). It was called, *Bruttia*, which in Greek signifies *pitch*, from the great quantity of it produced there, (Bochart). It is divided into two coasts by the Apennine; that on the Tuscan and that on the Ionian Sea. Now called *Calabria Ultra*. Different from the ancient Calabria or Messapia, to the east on the Adriatic or Ionian sea, and which formed the other peninsula or heel of the leg, now called *Calabria Citra*, the Bruttii forming the foot.

BRUTTON, a town of Somersetshire, in England. It is situated on the river Brew; and is a good place, and well inhabited. It is adorned with a very beautiful church; has a free school, founded by Edward I.; and the alms-house or hospital is so good, that it has the appearance of a college. They have a woollen manufactory of cloth and serges, and they are likewise noted for their malt. W. Long. 2. 30. N. Lat. 51. 15.

BRUTUS, or **BRUTE**, according to the old exploded history of this country by Geoffrey of Monmouth, was the first king of Britain. He is said to have been the son of Sylvius, and he of Aeneas the son of Æneas, and born in Italy: killing his father by chance, he fled into Greece, where he took king Pandrusus prisoner, who kept the Trojans in slavery, whom he released on condition of providing ships, &c. for the Trojans to forsake the land. Being advised by the oracle to sail west beyond Gaul, he, after some adventures, landed at Totness in Devonshire. Albion was then inhabited by a remnant of giants, whom Brutus destroyed: and called the island, after his own name, *Britain*. He built a city called *New Troy*, since London; and having reigned here 24 years, at his death parcelled the island among his three sons: Loerine had the middle, called *Logria*; Camber had Wales, and Albana Scotland.

BRUTUS (Lucius Junius), the avenger of the rape of Lucretia, and founder of the Roman republic, flourished 509 years before Christ. See (*History of*) ROME.

BRUTUS (Marcus), the passionate lover of his country, and chief conspirator against Cæsar, slew himself on losing the battle of Philippi, 42 years before Christ. See (*History of*) ROME.

BRUTUS (John Michael), a man of learning, and a polite writer, in the 16th century. He was a native of Venice; and, having studied at Padua, spent great part of his life in travelling, and became historiographer to his imperial majesty. He wrote, 1. A history of Hun-

gary. 2. A history of Florence. 3. Notes on Horace, Cæsar, Cicero, &c.; and other works. He was living in the year 1590.

BRUTUS (Stephen Junius), the disguised author of a political work intitled *Vindiciæ contra tyrannos*. See LANGUET.

BRUYERE (John de la), a celebrated French author, was born at Dourdan in the year 1664. He wrote *Characters*, describing the manners of his age, in imitation of Theophrastus; which characters were not always imaginary or general, but descriptive, as was well known, of persons of considerable rank. In the year 1693, he was by an order of the king chosen a member of the French academy; and died in the year 1696.—“The *Characters of Bruyere* (says Voltaire) may justly be ranked among the extraordinary productions of this age. Antiquity furnishes no examples of such a work. A style rapid, concise, and nervous; expressions animated and picturesque; an use of language altogether new, without offending against its established rules, struck the public at first; and the allusions, which are crowded in almost every page, completed its success. When La Bruyere showed his work in manuscript to Malesieu, this last told him, that the book would have many readers, and its author many enemies. It somewhat sunk in the opinion of men, when that whole generation whose follies it attacked were passed away; yet, as it contains many things applicable to all times and places, it is more than probable that it will never be forgotten.”

BRUYIERS, a town of Lorraine in Vosque, with a provostship. E. Long. 6. 45. N. Lat. 48. 15.

BRYANS-BRIDGE, a town of Ireland, in the county of Clare and province of Connaught, seated on the river Shannon, eight miles north of Limeric. W. Long. 8. 30. N. Lat. 52. 31.

BRYANT (Sir Francis), a soldier, statesman, and a poet of no inconsiderable fame in his time, was born of a genteel family, educated at Oxford, and afterwards spent some time in travelling abroad. In the year 1522, the 14th of Henry VIII. he attended, in a military capacity, the earl of Surrey on his expedition to the coast of Brittany; and commanded the troops in the attack of the town of Morlaix, which he took and burnt. For this service he was knighted on the spot by the earl. In 1528, he was in Spain; but on what service is doubtful. In 1529, he was sent ambassador to France; and, the year following, to Rome on account of the king's divorce. He had also been there in 1522, in the same capacity, when cardinal Woolsey's election to the holy see was in agitation. He was gentleman of the privy chamber to king Henry VIII. and to his successor Edward VI. in the beginning of whose reign he marched with the protector against the Scots; and after the battle of Muffelburgh, in which he commanded the light horse, was made banneret. In 1548, he was appointed chief governor of Ireland, where he married the countess of Ormond. He died soon after, and was buried at Waterford. He wrote, 1. Songs and sonnets; some of which were printed with those of the earl of Surrey and Sir Thomas Wyatt. Lond. 1565. 2. Letters written from Rome concerning the king's divorce; manuscript. 3. Various letters of state; which Ant. Wood says he had seen. 4. A dispraise of the life of a cour-

Bryum.

courtier, &c. Lond. 1548, 8vo. from the French of Alaygri, who translated it from the Castilian language, in which it was originally written by Guevara.

BRYE (John Theodore de), an excellent engraver, was a native of Liege; but he resided chiefly at Franckfort, where he carried on a considerable commerce in prints. It does not appear when he was born, nor to what master he owed his instructions in the art of designing and engraving. He worked almost entirely with the graver, and seldom called in the assistance of the point. He acquired a neat, free style of engraving, excellently well adapted to small subjects, in which many figures were to be represented; as *funeral parades*, *processions*, and the like, which he executed in a charming manner. He also drew very correctly. His heads in general are spirited and expressive, and the other extremity of his figures well marked. His back-grounds, though frequently very slight, are touched with a masterly hand. He died, as his sons inform us in the third part of Boissard's collection of portraits, on March 27th, 1598; the two first parts of which collection were engraved by himself, assisted by his sons, who afterwards continued it.

BRYENNIUS (Manuel), a Greek writer on music, is supposed to have flourished under the elder Paleologus, viz. about the year of Christ 1120. He wrote three books on Harmonics; the first whereof is a kind of commentary on Euclid, as the second and third are on Ptolemy. He professes to have studied perspicuity for the sake of young men. Meibomius had given the public expectations of a translation of this work: but not living to complete it, Dr Wallis undertook it; and it now makes a part of the third volume of his works, published at Oxford in three volumes folio, 1699.

BRYENNIUS (Nicephorus), a prince distinguished by his courage, probity, and learning, was born at Orestia in Macedonia; where his father by rebellion provoked the emperor to send his general Alexis Comnenus against him, who ordered his eyes to be pulled out; but being charmed with his son Bryennius, he married him to Anne Comnenus his daughter, so famous by her writings. When Alexis came to the throne, he gave Bryennius the title of *Cæsar*; but would not declare him his successor, though solicited to it by the empress Irene; and was therefore succeeded by his son John Comnenus, to whom Bryennius behaved with the utmost fidelity. Being sent, about the year 1137, to besiege Antioch, he fell sick; and, returning, died at Constantinople. This prince wrote the *History of Alexis Comnenus*, which he composed at the request of his mother-in-law the empress Irene.

BRYGMUS, among physicians, a grating noise made by the gnashing of the teeth.

BRYONIA, **BRYONY**: A genus of the syngenesia order, belonging to the monœcia class of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The calyx of the male is five-toothed, with a quinquefid corolla, and three filaments. In the female the calyx is dentated, the corolla quinquefid, the style trifold, with a roundish many-seeded berry.

Species. 1. The alba, rough, or white bryony with red flowers, is a native of dry banks under hedges in many parts of Britain. The roots of this plant have by impostors been brought into a human shape, and shown for mandrakes. The method practised by these

people was to find a young thriving plant of bryony; then they opened the earth all round, being careful not to disturb the lower fibres; and being provided with such a mould as is used for making plaster figures, they fixed the mould close to the root, fastening it with wire to keep it in its proper situation: then they filled the earth about the root, leaving it to grow to the shape of the mould; which in one summer it will do; so that if this is done in March, by September it will have the shape. The leaves of this plant are also imposed on people for mandrake-leaves; although there is no resemblance between them, nor any agreement in quality.

2. The africana, or African tuberos root bryony.
3. The racemosa, or bryony with a red olive-shaped fruit. These are natives of warm climates; and are perennial; but their branches decay every winter. They flower in July, and in warm summers will perfect their seeds in Britain.
4. The cretica, or spotted bryony of Crete.
5. The variegata, or American bryony with a variegated fruit.
6. The bonariensis, or bryony with hairy palmated leaves, divided into five parts, and obtuse segments. These are likewise natives of warm countries; but merit cultivation on account of the pretty appearance they make when the plants are full of fruit.

Culture. The second and third sorts are to be planted in pots filled with fresh light earth; and in winter must be placed in the green-house to protect them from frosts and great rains, which would destroy them if they were exposed thereto. In summer, they may be exposed to the open air, and must be frequently refreshed with water in dry weather. The three last sorts are annual plants: they must be raised on a hot-bed early in the spring; and when the plants are about three inches high, they should be each transplanted into a small pot, and plunged into a hot-bed of tanner's bark. When the plants are grown so large as to ramble about on the surface of the bed, and begin to entangle with other plants, they should be shifted into larger pots, and placed in the bark-stove; where their branches may be trained to the wall, or against an espalier, that they may have sun and air, which is absolutely necessary for their producing fruit.

Medicinal Uses, &c. The roots of the first species are used in medicine. These are very large, sometimes as thick as a man's thigh: their smell, when fresh, is strong and disagreeable; the taste nauseously bitter, acrid, and biting; the juice is so sharp, as in a little time to excoriate the skin; in drying, they lose great part of their acrimony, and almost their whole scent.—Bryony-root is a strong irritating cathartic; and as such has sometimes been successfully exhibited in maniacal cases, in some kinds of dropsies, and in several chronical disorders, where a quick solution of viscid juices and a sudden stimulus on the solids were required. An extract prepared by water acts more mildly, and with greater safety, than the root in substance: given from half a dram to a dram, it is said to prove a gentle purgative, and likewise to operate powerfully by urine.—Bryony-root, applied externally, is said to be a powerful disicant.

Black Bryony. See TAMUS.

BRYUM, in botany: A genus of the 56th natural order, viz. *Musci*, belonging to the cryptogamia class of plants. The anthera is operculated or covered with a lid, the calyptra polished; and there is a filament arising

^{Boa}
^{Bubastis.} from the terminal tubercle. There are 41 species, most of them natives of Britain.

BUA, an island of the gulph of Venice, on the coast of Dalmatia, near the town of Trau; called likewise the *Partridge-island*, because frequented by those birds. It is called *Bubus* by Pliny. In the times of the decay of the empire it was called *Boas*; and several illustrious men that fell under disgrace at court were banished to this island; among whom were Florentius, master of the offices of the emperor Julian, Immentius de Valenti, and the heretic Jovinian. The emperors of Constantinople either were not much acquainted with this pretended Siberia, or were willing to treat the banished with great clemency. It is certain that the climate of this island is exceeding mild; the air perfectly good; the oil, grapes, and fruit excellent; and the sea around it abounds in fish, and the port is large and secure. Neither is it so small that a man has not room to walk and ride about as much as he pleases; for it is ten miles in length, and about twenty-five in circuit; nor can it be said to be rugged, though rather high and mountainous.

BUANES, a town of France, in Gascony, and in the diocese of Aire, seated on the river Bahus, in E. Long. 0. 5. N. Lat. 43. 47.

BUARCOS, a town of Portugal, in the province of Beira. W. Long. 8. 5. N. Lat. 40. 3.

BUBALIS, in zoology, the trivial name of the buffalo, a species of the bos. See Bos.

BUBASTIS, in the Egyptian mythology, one of the names of Isis or the moon. The Egyptians bestowed different names on the sun, either to characterize his effects or his relations with respect to the earth; they followed the same method respecting the moon. Chæremon, a sacred writer of Egypt, leaves no doubt on this subject. "Every thing which is published of Osiris and Isis, all the sacerdotal fables, allude only to the phases of the moon, and the course of the sun." Bubastis was one of the principal attributes of Isis. Theology having personified her, formed of her a divinity, in whose honour a city of that name was built, as described by Herodotus, and where the people collected from all parts of Egypt, at a certain period of the year. A cat was the symbol of this deity. The priests fed it with sacred food; and when it died, they embalmed its body, and carried it in pomp to the tomb prepared for it. The ancients have explained this worship variously. The Greeks pretend that when Typhon declared war against the gods, Apollo transformed himself into a vulture, Mercury into an ibis, and Bubastis into a cat, and that the veneration of the people for the latter animal took rise from that fable; but they ascribe their own ideas to the Egyptians, who thought very differently. However that may be, the cat was greatly honoured in Egypt, and a Roman soldier having imprudently killed one, was immediately put to death by the populace.

Bubastis, in the language of the priests, was deemed the daughter of Isis, and even represented her in certain circumstances. It is for this reason that the Greeks, who honoured the moon by the name of *Diana*, bestowed it also on this Egyptian divinity. Bubastis, says Herodotus, is called *Diana* by the Greeks. The Egyptians attributed to her the virtue of assiling pregnant women. The Greeks and Latins, disciples of

the Egyptians, ascribed the same power to Diana; and Horace does not think it unworthy of his pen to address the following litrophe to her:

*Montium cuflos namerunqve, Virgo,
Quæ laborantes utero puellas
Ter vocata audis, adinijque letho,
Dioa Triformis.*

The philosopher will seek for the origin of this ancient worship in the laws imposed by nature on women, and which in some measure follow the lunar revolutions. The natural philosophers and the poets buried it under allegories unintelligible to the people.

A perfect resemblance, however, does not exist between the two deities we have been speaking of. The Greeks constituted Diana goddess of the chase and of the forests; an attribute the Egyptians did not acknowledge in Bubastis. The former added, that she was the daughter of Jupiter and Latona, and Bubastis was produced by Osiris and Isis.

A barbarous custom was introduced at the festivals celebrated in honour of Bubastis, called by the Greeks also *Ilithyia* or *Lucina*, to mark her presiding over childbirth. The Egyptians adored her under this name in the city of Ilithyia, situated near Latopolis.

It remains to resolve a question which naturally arises here: How could Bubastis be called the daughter of Isis, since she also was a symbol of the moon? The Egyptian theology easily explains these apparent contradictions. Isis was the general appellation of the moon, Bubastis a particular attribute. The sun, in conjunction with the star of the night, formed the celestial marriage of Osiris and Isis; the crescent which appears three days after was allegorically called their daughter. It is in this sense that the Hebrews called this same phenomenon, *the birth of the moon*, and that Horace says,

*Cxlo fupinas fe tuleris manus,
Nafcente luni, ruffica Phi fyle, &c. &c.*

These observations inform us, why in the city of Ilithyia, where Bubastis was adored, the third day of the lunar month was consecrated by a particular worship. In fact, it is three days after the conjunction that the moon, disengaged from the rays of the sun, appears as a crescent, and is visible to us. The Egyptians celebrated therefore a solemnity in honour of Bubastis, which in their tongue signified *new moon*. The crescent with which her head was crowned, expresses palpably the intention of the priests in creating this symbolical divinity.

BUBBLE, in philosophy, small drops or vesicles of any fluid filled with air; and formed either on its surface by an addition of more of the fluid, as in raining, &c.; or in its substance, by an intestine motion of its component particles. Bubbles are dilatible or compressible, *i. e.* they take up more or less room as the included air is more or less heated, or more or less pressed from without; and are round, because the included air acts equally from within all around.

BUEBLE, in commerce, a cant term given to a kind of project for raising money on imaginary grounds, much practised in France and England in the years 1719, 1720, and 1721.

The pretence of those schemes was the raising a capital for retrieving, setting on foot, or carrying on, some

Bubo.
Bubon.

some promising and useful branch of trade, manufacture, machinery, or the like. To this end proposals were made out, showing the advantages to be derived from the undertaking, and inviting persons to be engaged in it. The sum necessary to manage the affair, together with the profits expected from it, were divided into shares or subscriptions, to be purchased by any disposed to adventure therein.

Bubbles, by which the public have been tricked, are of two kinds, viz. 1. Those which we may properly enough term *trading-bubbles*; and, 2. Stock or fund bubbles. The former have been of various kinds; and the latter at different times, as in 1719 and 1720.

BUBO, in ornithology, the trivial name of a species of strix. See STRIX.

BUBO, or *Buboe*, in surgery, a tumour which arises with inflammation, only in certain or particular parts to which they are proper, as in the arm-pits and in the groins. See MEDICINE-Index.

BUBON, MACEDONIAN PARSLEY: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is ovated, striated, and villous.

Species. 1. The macedonicum sends out many leaves from the root; the lower of which grow almost horizontally, spreading near the surface of the ground; the foot-stalk of each leaf divides into several smaller; which are garnished with smooth rhomb-shaped leaves, which are of a bright pale-green colour, and sawed on their edges. In the centre of the plant arises the flower-stem, which is little more than a foot high, dividing into many branches, each being terminated by an umbel of white flowers, which are succeeded by oblong hairy seeds. This plant, in warm countries, is biennial; the plants, which rise from seeds, one year produce flowers, and seeds the next, and then perish; but in Britain they seldom flower till the third or fourth year from the seed; but whenever the plant flowers, it always dies. 2. The rigidus, hard or rigid ferula, is a native of Sicily. It is a low perennial plant, having short, stiff, and very narrow leaves: the flower-stalk rises a foot high, which is terminated by an umbel of small white flowers; which are succeeded by small, oblong, channelled seeds. It is a plant of little beauty or use, so is only cultivated for the sake of variety. 3. The galbanum or African ferula, rises with an upright stalk to the height of eight or ten feet, which at bottom is woody, having a purplish bark covered with a whitish powder that comes off when handled. The upper part of the stalk is garnished with leaves at every joint, the foot-stalks half-embracing them at their base, and are set with leaves like those of the lovage, but smaller, and of a grey colour: the top of the stalk is terminated by an umbel of yellow flowers; which are succeeded by oblong channelled seeds, which have a thin membrane or wing on their border. When any part of the plant is broken, there issues out a little thin milk of a cream colour, which hath a strong scent of galbanum. 4. The gummiferum, with a mock chervil leaf, rises with a ligneous stalk about the same height; and is garnished with leaves at each joint, which branch out like the former; but the small leaves or lobes are narrow and indented like those of baltard hemlock. The stalk is

terminated by an umbel of small yellow flowers, which are succeeded by seeds like those of the former sort.— These plants are all propagated by seeds, and require the common culture of other exotic vegetables. The galbanum of the shops is supposed to be procured from the third and fourth sorts.

BUBONOCELE, or HERNIA INGUINALIS, in surgery, a tumor in the inguen, formed by a prolapsus of the intestines, omentum, or both, through the processes of the peritoneum and rings of the abdominal muscles. See SURGERY.

BUBONIUM, in botany, a synonyme of the ISULA.

BUC (George), a learned English antiquarian, flourished in the beginning of the 17th century. In the reign of king James I. he was made one of the gentlemen of his majesty's privy-chamber, and knighted: he was also constituted master of the revels. What he most distinguished himself by was his writing, 1. The history of the reign of Richard III.; in which he takes great pains to wipe off the bloody stains that have blotted his character, and represents the person and actions of that prince in a much less odious light than other historians have done. He also wrote, 2. A treatise of the art of revels; and, 3. a work entitled The third universitie of England.

BUCANEER, one who dries and smokes flesh or fish after the manner of the Indians. The name was particularly given to the first French settlers on the island of St Domingo, whose sole employment consisted in hunting bulls or wild boars, in order to sell their hides and flesh. The name has also been applied to those famous piratical adventurers, chiefly English and French, who joined together to make depredations on the Spaniards of America. Of both these we shall give an account.

1. *The Buccaneers of St Domingo*. The Spaniards had not been long in the possession of the West Indies and the continent of America, when other nations, especially the English and French, began to follow them there. But though the Spaniards were unable to people such extensive countries themselves, they were resolved that no others should do it for them; and therefore made a most cruel war on all those of any other nation who attempted to settle in any of the Antilla or Caribbee islands. The French, however, were at last lucky enough to acquire some footing in the island of St Christopher's; but by the time they began to subside into a regular form of government, the Spaniards found means to dislodge them. Upon this the wretched fugitives, considering at how great a distance they were from their mother-country, and how near to the island of Hispaniola or St Domingo, the northern parts of which were then uninhabited and full of swine and black cattle, immediately resolved to take possession of that country, in conjunction with several other adventurers of their own and the English nation; especially as the Dutch, who now began to appear in these seas, promised to supply them plentifully with all kinds of necessaries they might require, in exchange for the hides and tallow they should procure by hunting.

These new settlers obtained the name of *bucaniers*, from their custom of bucaning their beef and pork in order to keep it for sale, or for their own consumption, the method of which will be presently described. But

Bucanier Some of them soon grew tired of this new way of life, and took to planting; while many more chose to turn pirates, trusting to find among those who remained on shore a quick sale for all the plunder they could make at sea. This new body of adventurers were called *freebooters*, from their making free prey or booty of whatever came in their way.

The colony now began to thrive at a great rate, by the cheap and easy manner in which the free-booters acquired the greatest riches, and the profusion with which they distributed them among their old companions the bucaniers and planters for the meekest trifles. This brought numbers of settlers from Old France in quality of indented servants, though they toiled rather like slaves during the three years for which they generally bound themselves. One of these men presuming to represent to his master, who always fixed upon a Sunday for sending him with skins to the port, that God had forbidden such a practice, when he had declared, "Six days shalt thou labour, and on the seventh day shalt thou rest:" "And I (replied the brutal bucanier) say to thee, Six days shalt thou kill bulls, and strip them of their skins, and on the seventh day shalt thou carry their hides to the sea-shore." This command was followed by blows, which sometimes enforce obedience, sometimes disobedience, to the laws of God.

Thus the colony consisted of four classes: bucaniers; freebooters; planters; and indented servants, who generally remained with the bucaniers or planters. And these four orders composed what they now began to call the *body of adventurers*. These people lived together in a perfect harmony under a kind of democracy: every freeman had a despotic authority over his own family; and every captain was a sovereign in his own ship, tho' liable to be discarded at the discretion of the crew.

The planters settled chiefly in the little island of Tortuga on the northern coast of Hispaniola: but it was not long before some of them going to the great island to hunt with the bucaniers, the rest were surprised by the Spaniards; and all, even those who had surrendered at discretion in hopes of mercy, were put to the sword or hanged.

The next care of the Spaniards was to rid the great island of the bucaniers; and for this reason they assembled a body of 500 lance-men, who, by their seldom going fewer than 50 in a company, obtained the name of *the Fifties* from their enemies, whose manners and customs we shall now enter upon.

The bucaniers lived in little huts built on some spots of cleared ground, just large enough to dry their skins on, and contain their bucaning houses. These spots they called *Bourans*, and the huts they dwelt in *Ajoupas*, a word which they borrowed from the Spaniards, and the Spaniards from the natives. Though these ajoupas lay open on all sides, they were very agreeable to the hardy inhabitants, in a climate where wind and air are so very desirable things. As the bucaniers had neither wife nor child, they associated by pairs, and mutually rendered each other all the services a master could reasonably expect from a servant, living together in so perfect a community, that the survivor always succeeded his deceased partner. This kind of union or fellowship they called *fraternite* [insaloring], and each other *frat*, [salon], whence is derived the custom of gi-

Bucanery. ving, at least in some parts of the French Antilles, the name *motelotage* [sailorage], to any kind of society formed by private persons for their mutual advantage. They behaved to each other with the greatest justice and openness of heart: it would have been a crime to keep any thing under lock and key; but, on the other hand, the least pilfering was unpardonable, and punished with expulsion from the community. And indeed there could be no great temptation to steal, when it was reckoned a point of honour, never to refuse a neighbour what he wanted; and where there was so little property, it was impossible there should be many disputes. If any happened, the common friends of the parties at variance interposed, and soon put an end to the difference.

As to laws, the bucaniers acknowledged none but an odd jumble of conventions made between themselves, which, however, they regarded as the sovereign rule. They silenced all objections by coolly answering, that it was not the custom of the coast; and grounded their right of acting in this manner, on their baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marine ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had very little authority over them; they contented themselves with rendering him from time to time some slight homage. They had in a manner entirely shaken off the yoke of religion, and thought they did a great deal in not wholly forgetting the God of their fathers. We are surprised to meet with nations, among whom it is a difficult matter to discover any trace of a religious worship: and yet it is certain, that had the bucaniers of St Domingo been perpetuated on the same footing they subsisted at the time we are speaking of, the third or fourth generation of them would have as little religion as the Caffres and Hottentots of Africa, or the Topinambous and Cannibals of America.

They even laid aside their surnames, and assumed nick-names, or martial names, most of which have continued in their families to this day. Many, however, on their marrying, which seldom happened till they turned planters, took care to have their real surnames inserted in the marriage-contract; and this practice gave occasion to a proverb, still current in the French Antilles, *a man is not to be known till he takes a wife*.

Their dress consisted of a filthy greasy shirt, dyed with the blood of the animals they killed; a pair of trousers still more nasty: a thong of leather by way of belt, to which they hung a case containing some Dutch knives, and a kind of very short sabre called *Manchette*; a hat without any brim, except a little flap on the front to take hold of it by; and shoes of hogskin all of a piece. Their guns were four feet and a half in the barrel, and of a bore to carry balls of an ounce. Every man had his contract servants, more or fewer according to his abilities; besides a pack of 20 or 30 dogs, among which there was always a couple of beagles. Their chief employment at first was ox-hunting; and, if at any time they chased a wild hog, it was rather for pastime, or to make provision for a feast, than for any other advantage. But, in process of time, some of them betook themselves entirely to hunting of hogs, whose flesh they bucanied in the following manner: First, they cut the flesh into long pieces, an inch and an half thick,

and

and sprinkled them with salt, which they rubbed off after 24 hours. Then they dried these pieces in stoves over the fire made of the skin and bones of the beast, till they grew as hard as a board, and assumed a deep brown colour. Pork prepared in this manner will keep in casks a twelvemonth and longer; and when steeped but a little while in lukewarm water, become plump and rosy, and yield moreover a most grateful smell, either broiled or boiled, or otherwise dressed, enough to tempt the most languid appetite and please the most delicate palate. Those who hunt the wild boar, have of late been called simply *hunters*.

In hunting, they set out at day-break, preceded by the beagles, and followed by their servants with the rest of the dogs; and as they made it a point never to balk their beagles, they were often led by them over the most frightful precipices, and through places which any other mortal would have deemed absolutely impassable. As soon as the beagles had roused the game, the rest of the dogs struck up and surrounded the beast, stopping it, and keeping a constant barking till the bucaneer could get near enough to shoot it; in doing this, he commonly aimed at the pit of the breast; when the beast fell, he hamstringed it, to prevent its rising again. But it has sometimes happened that the creature, not wounded enough to tumble to the ground, has run furiously at his pursuer, and ripped him open. But, in general, the bucaneer seldom missed his aim; and when he did, was nimble enough to get up the tree behind which he had the precaution to place himself. What is more; some of them have been seen to overtake the beast in chase, and hamstring it without any further ceremony.

As soon as the prey was half skinned, the master cut out a large bone, and sucked the marrow for breakfast. The rest he left to his servants, one of whom always remained behind to finish the skinning, and bring the skin with a choice piece of meat for the huntsmen's dinner. They then continued the chase till they had killed as many beasts as there were heads in the company. The master was the last to return to the boucan, loaded like the rest with a skin and a piece of meat. Here the bucaneeers found their tables ready: for every one had his separate table; which was the first thing, any way fit for the purpose, that came in their way, a stone, the trunk of a tree, and the like. No table-cloth, no napkin, no bread or wine, graced their board; not even potatoes or bananas, unless they found them ready to their hands. When this did not happen, the fat and lean of the game, taken alternately, served to supply the place. A little pimento, and the squeeze of an orange, their only sauce; contentment, peace of mind, a good appetite, and abundance of mirth, made every thing agreeable. Thus they lived and spent their time, till they had completed the number of hides for which they had agreed with the merchants; which done, they carried them to Tortuga, or some port of the great island.

As the bucaneeers used much exercise, and fed only on flesh meat, they generally enjoyed a good state of health. They were indeed subject to fevers, but either such as lasted only a day, and left no sensible impression the day following; or little slow fevers, which did not hinder them from action, and were of course so little regarded, that it was usual with the patient, when

asked how he did, to answer, "Very well, nothing ails me but the fever." It was impossible, however, they should not suffer considerably by such fatigues under a climate to the heat of which few of them had been early enough inured. Hence the most considerate among them, after they had got money enough for that purpose, turned planters. The rest soon spent the fruits of their labour in taverns and tippling-houses; and many had so habituated themselves to this kind of life, as to become incapable of any other. Nay, there have been instances of young men, who having early embarked through necessity in this painful and dangerous profession, persisted in it afterwards, merely through a principle of libertinism, rather than return to France and take possession of the most plentiful fortunes.

Such were the bucaneeers of St Domingo, and such their situation, when the Spaniards undertook to extirpate them. And at first they met with great success; for as the bucaneeers hunted separately, every one attended by his servants, they were easily surpris'd. Hence the Spaniards killed numbers, and took many more, whom they condemned to a most cruel slavery. But whenever the bucaneeers had time to put themselves into a state of defence, they fought like lions, to avoid falling into the hands of a nation from whom they were sure to receive no quarter; and by this means they often escaped: nay, there are many instances of single men fighting their way through numbers. These dangers, however, and the success of the Spaniards in discovering their boucans, where they used to surprise and cut the throats of them and their servants in their sleep, engaged them to cohabit in greater numbers, and even to act offensively, in hopes that by so doing they might at last induce the Spaniards to let them live in peace. But the fury with which they behaved whenever they met any Spaniards, served only to make their enemies more intent on their destruction; and assistance coming to both parties, the whole island was turned into a slaughter-house, and so much blood spilt on both sides, that many places, on account of the carnage of which they had been the theatres, were intitled, *of the massacre*: such as *the hill of the massacre*; *the plain of the massacre*; *the valley of the massacre*; which names they retain to this day.

At length the Spaniards grew tired of this way of proceeding, and had recourse to their old method of surprise, which against enemies of more courage than vigilance was like to succeed better. This put the bucaneeers under a necessity of never hunting but in large parties, and fixing their boucans in the little islands on the coast, where they retired every evening. This expedient succeeded; and the boucans, by being more fixed, soon acquired the air and consistency of little towns.

When the bucaneeers had once fixed themselves, as related, each boucan ordered scouts every morning to the highest part of the island, in order to reconnoitre the coast, and see if any Spanish parties were abroad. If no enemy appeared, they appointed a place and hour of rendezvous in the evening, and were never absent if not killed or prisoners. When therefore any one of the company was missing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or avenged his death if killed.

Things continued in this situation for a long time, till the Spaniards made a general hunt over the whole

Bucaneers. island; and, by destroying their game, put the bucaneeers under a necessity of betaking themselves to another course of life. Some of them turned planters; and thereby increased some of the French settlements on the coast, and formed others. The rest, not relishing so confined and regular a life, entered among the freebooters, who thereby became a very powerful body.

France, who had hitherto disclaimed for her subjects these ruffians whose successes were only temporary, acknowledged them, however, as soon as they formed themselves into settlements; and took proper measures for their government and defence. See the article *St Domingo*.

The hunting both of the bull and boar is at this day carried on, and proves of considerable importance. That of the former furnishes France with the finest hides brought from America. The bucaneeers put the hide in packs which they call loads, mixing together hides of full grown bulls, of young bullocks, and of cows. Each of these loads is composed of two bull-hides, or of an equivalent; that is to say, either of two real bull-hides, or of one bull-hide and two cow-hides, or of four cow-hides, or of three young bullocks hides; three bullocks hides being reckoned equivalent to two full-grown bulls hides, and two cows hides equivalent to one bull's hide. These bulls they commonly call *svex* in France, though they be not gelt. Each load is commonly sold for six pieces of eight rials, which is a Spanish coin, the French coin being but little current, or not at all, in the island of St Domingo.

The boar meat bucaned in the manner above mentioned is sold by the bundle or pack, weighing commonly 60 pounds, at the rate of six pieces of eight per pack. The palm-leave serves to pack it up in; but their weight is deducted, so that there must be in each pack 60 pounds of net flesh. These bucaneeers have also a great trade of the lard of bears, which they melt, and gather in large pots called *petiches*. This lard, which is called *mantegua*, is also sold for about eight pieces of eight per pot. There is a great trade, and a great consumption of each of these merchandizes in the French settlements of the island of St Domingo, and in those of Tortuga: besides which, they used to send great quantities of them to the Antilles, and even into the continent of French America. There is also a great deal of it sold for the support of the crews of the ships that come from France for trading, or which the privateers of Tortuga fit out for cruising against the Spaniards.

The Spaniards, who have large settlements in the island of St Domingo, have also their bucaneeers there, whom they call *matadores* or *monteros*. Their chase has something noble, which favours of the Spanish pride: the huntsman being on horseback, uses the lance to strike the bull, thinking it beneath his courage to shoot him at a distance. When the servants, who are on foot, have discovered the beast, and with their dogs have driven it into some savannah or meadow, in which the master waits for them on horseback, armed with two lances, that matadore goes and hamstrings it with the first lance, the head of which is made like a crescent or half-moon, and extremely sharp, and kills it afterwards with the other lance, which is a common one. This chase is very agreeable; the huntsman making com-

monly, in order to attack the bull, the same turns and the same ceremonies which are practised in those festivals so famous in Spain, wherein the greatest lords expose themselves sometimes to the view of the people, to make them admire their dexterity and intrepidity in attacking these furious animals: but then it is a very dangerous chase; those bulls, in their fury, often running directly against the huntsman, who may think himself very happy if he comes off only with the loss of his horse, and if he himself is not mortally wounded.

The Spaniards dress their hides like the French, who have learned it from them; and these hides being carried to the Havannah, a famous harbour in the island of Cuba, are part of the trade of that celebrated town. The flota and the galleons scarce ever sail touching there, on their return from Vera Cruz and Porto Bello, and load there those hides which they carry into Spain, where they are sold for Havannah hides, the most esteemed of any that are brought from America into Europe.

II. BUCANEERS, the Pirates. Before the English had made any settlement at Jamaica, and the French at St Domingo, some pirates of both nations, who have since been too much distinguished by the name of *Bucaneers*, had driven the Spaniards out of the small island of Tortuga; and, fortifying themselves there, had with an amazing intrepidity made excursions against the common enemy. They formed themselves into small companies, consisting of 50, 100, or 150 men each. A boat, of a greater or smaller size, was their only armament. Here they were exposed night and day to all the inclemencies of the weather, having scarce room enough to lie down. A love of absolute independence, the greatest blessing to those who are not proprietors of land, rendered them averse from those mutual restraints which the members of society impose upon themselves for the common good; some of them chose to sing, while others were desirous of going to sleep. As the authority they had conferred on their captain was confined to his giving orders in battle, they lived in the greatest confusion. Like the savages, having no apprehension of want, nor any care to preserve the necessaries of life, they were constantly exposed to the severest extremities of hunger and thirst. But deriving, even from their very distresses, a courage superior to every danger, the sight of a ship transported them to a degree of frenzy. They never deliberated on the attack, but it was their custom to board the ship as soon as possible. The smallness of their vessels, and the skill they showed in the management of them, screened them from the fire of the greater ships; and they presented only the fore part of their little vessels filled with fusileers; who fired at the port-holes with so much exactness, that it entirely confounded the most experienced gunners. As soon as they threw out the grappling, the largest vessel seldom escaped them.

In cases of extreme necessity, they attacked the people of every nation, but fell upon the Spaniards at all times. They thought that the cruelties the latter had exercised on the inhabitants of the new world justified the implacable aversion they had sworn against them. But this was heightened by a personal pique, from the mortification they felt in seeing themselves debarred from the privilege of hunting and fishing, which they con-

Bucaneers.

*Royal's
Hist. of the
Indies.*

considered as natural rights. Such were their principles of justice and religion, that, whenever they embarked on any expedition, they used to pray to heaven for the success of it; and they never came back from the plunder, but they constantly returned thanks to God for their victory.

The ships that sailed from Europe into America seldom tempted their avidity. The merchandize they contained would not easily have been sold, nor been very profitable to these barbarians in those early times. They always waited for them on their return, when they were certain that they were laden with gold, silver, jewels, and all the valuable productions of the new world. If they met with a single ship, they never failed to attack her. As to the fleets, they followed them till they sailed out of the gulph of Bahama; and as soon as any one of the vessels was separated by accident from the rest, it was taken. The Spaniards, who trembled at the approach of the bucaners, whom they called *devils*, immediately surrendered. Quarter was granted, if the cargo proved to be a rich one; if not, all the prisoners were thrown into the sea.

The bucaners, when they had got a considerable booty, at first held their rendezvous at the island of Tortuga, in order to divide the spoil; but afterwards the French went to St Domingo, and the English to Jamaica. Each person, holding up his hand, solemnly protested that he had secreted nothing of what he had taken. If any one among them was convicted of perjury, a case that seldom happened, he was left, as soon as an opportunity offered, upon some desert island, as a traitor unworthy to live in society. Such brave men among them as had been maimed in any of their expeditions, were first provided for. If they had lost a hand, an arm, a leg, or a foot, they received 26l. An eye, a finger, or a toe, lost in fight, was valued only at half the above sum. The wounded were allowed 2s. 6d. a day for two months, to enable them to have their wounds taken care of. If they had not money enough to answer these several demands, the whole company were obliged to engage in some fresh expedition, and to continue it till they had acquired a sufficient stock to enable them to satisfy such honourable contracts.

After this act of justice and humanity, the remainder of the booty was divided into as many shares as there were bucaners. The commander could only lay claim to a single share as the rest; but they complimented him with two or three, in proportion as he had acquitted himself to their satisfaction. Favour never had any influence in the division of the booty; for every share was determined by lot. Instances of such rigid justice as this are not easily met with; and they extended even to the dead. Their share was given to the man who was known to be their companion when alive, and therefore their heir. If the person who had been killed had no intimate, his part was lent to his relations when they were known. If there were no friends or relations, it was distributed in charity to the poor and to churches, which were to pray for the person in whose name these benefactions were given.

When these duties had been complied with, they then indulged themselves in all kinds of profusion. Unbounded licentiousness in gaming, wine, women, every kind of debauchery, was carried to the utmost pitch

of excess, and was slopt only by the want which such profusions brought on. Those men who were enriched with several millions, were in an instant totally ruined, and destitute of clothes and provisions. They returned to sea; and the new supplies they acquired were soon lavished in the same manner.

The Spanish colonies, flattering themselves with the hopes of seeing an end to their miseries, and reduced almost to despair in finding themselves a perpetual prey to these ruffians, grew weary of navigation. They gave up all the power, conveniences, and fortune, which their connections procured them, and formed themselves almost into so many distinct and separate states. They were sensible of the inconveniences arising from such a conduct, and avowed them; but the dread of falling into the hands of rapacious and savage men, had greater influence over them than the dictates of honour, interest, and policy. This was the rise of that spirit of inactivity which continues to this time.

This dependency served only to increase the boldness of the bucaners. As yet they had only appeared in the Spanish settlements, in order to carry off some provisions when they were in want of them. They no sooner found their captures begin to diminish, than they determined to recover by land what they had lost at sea. The richest and most populous countries of the continent were plundered and laid waste. The culture of lands was equally neglected with navigation; and the Spaniards dared no more appear in their public roads, than sail in the latitudes which belonged to them.

Among the bucaners who signalized themselves in this new species of excursions, Montbar, a gentleman of Languedoc, particularly distinguished himself. Having by chance, in his infancy, met with a circumstantial account of the cruelties practised in the conquest of the new world, he conceived an aversion which he carried to a degree of frenzy against that nation which had committed such enormities. The enthusiasm of humanity worked him up to, was turned into a rage more cruel than that of religious fanaticism, to which so many victims had been sacrificed. The names of their unhappy sufferers seemed to rouse him, and call upon him for vengeance. He had heard some account of the bucaners, who were said to be the most inveterate enemies to the Spanish name: he therefore embarked on board a ship, in order to join them.

In the passage, they met with a Spanish vessel; attacked it; and, as it was usual in those times, immediately boarded it. Montbar, with a sabre in his hand, fell upon the enemy; broke through them; and, hurrying twice from one end of the ship to the other, levelled every thing that opposed him. When he had compelled the enemy to surrender, leaving to his companions the happiness of dividing to rich a booty, he contented himself with the savor pleasure of contemplating the dead bodies of the Spaniards, lying in heaps together, against whom he had sworn a constant and deadly hatred.

Fresh opportunities soon occurred, that enabled him to exert this spirit of revenge, without extinguishing it. The ship he was in arrived at the coast of St Domingo; where the bucaners on land immediately applied to barter some provisions for brandy. As the articles

they

Bucaners. they offered were of little value, they alleged in excuse, that their enemies had over-run the country, laid waste their settlements, and carried off all they could. "Why (replied Montbar) do you tamely suffer such insults?" "Neither do we (answered they in the same tone); the Spaniards have experienced what kind of men we are, and have therefore taken advantage of the time when we were engaged in hunting. But we are going to join some of our companions, who have been still more ill treated than we; and then we shall have warm work." "If you approve of it (answered Montbar), I will head you, not as your commander, but as the foremost to expose myself to danger." The bucaners, perceiving from his appearance that he was such a man as they wanted, cheerfully accepted his offer. The same day they overtook the enemy, and Montbar attacked them with an impetuosity that astonished the bravest. Scarce one Spaniard escaped the effects of his fury. The remaining part of his life was equally distinguished as on this day. The Spaniards suffered so much from him, both by land and at sea, that he acquired the name of the *Exterminator*.

His savage disposition, as well as that of the other bucaners who attended him, having obliged the Spaniards to confine themselves within their settlements, these free-booters resolved to attack them there. This new method of carrying on the war required superior forces; and their associations in consequence became more numerous. The first that was considerable was formed by Lolonois, who derived his name from the sands of Olones the place of his birth. From the abject state of a bondsmen, he had gradually raised himself to the command of two canoes, with 22 men. With these he was so successful as to take a Spanish frigate on the coast of Cuba. He then repaired to the Port-au-Prince, in which were four ships, fitted out purposely to sail in pursuit of him. He took them, and threw all the crew into the sea, except one man, whom he saved, in order to send him with a letter to the governor of the Havannah, acquainting him with what he had done, and assuring him that he would treat in the same manner all the Spaniards that should fall into his hands, not excepting the governor himself, if he should be so fortunate as to take him. After this expedition, he ran his canoes and prize-ships aground, and sailed with his frigate only to the island of Tortuga.

Here he met with Michael deBafco, who had distinguished himself by having taken, even under the cannon of Porto-Bello, a Spanish ship, estimated at 218,500*l.* and by other actions equally brave and daring. These two gave out, that they were going to embark together on an expedition equally glorious and profitable; in consequence of which they soon collected together 440 men. This body of men, the most numerous the bucaners had yet been able to muster, sailed to the bay of Venezuela, which runs up into the country for the space of 50 leagues. The fort that was built at the entrance of it for its defence was taken; the cannon were nailed up; and the whole garrison, consisting of 250 men, put to death. They then reembarked, and came to Maracaybo, built on the western coast of the lake of the same name, at the distance of ten leagues from its mouth. This city, which had become flourishing and rich by its trade in skins, tobacco, and cocoa, was deserted. The inhabitants had retired with

their effects to the other side of the bay. If the bucaners had not loit a fortnight in riot and debauch, they would have found at Gibraltar, near the extremity of the lake, every thing that the inhabitants had secreted to secure it from being plundered. On the contrary, they met with fortifications lately erected, which they had the useless satisfaction of making themselves masters of, at the expence of a great deal of blood; for the inhabitants had already removed at a distance the most valuable part of their property. Exasperated at this disappointment, they set fire to Gibraltar. Maracaybo would have shared the same fate, had it not been ransomed. Besides the sum they received for its ransom, they also carried off with them all the crosses, pictures, and bells of the churches; intending, as they said, to build a chapel in the island of Tortuga, and to consecrate this part of their spoils to sacred purposes. Such was the religion of these barbarous people, who could make no other offering to heaven than that which arose from their robberies and plunder.

While they were idly dissipating the spoils they had made on the coast of Venezuela, Morgan, the most renowned of the English bucaners, sailed from Jamaica to attack Porto-Bello. His plan of operations was so well contrived, that he surprised the city, and took it without opposition.

The conquest of Panama was an object of much greater importance. To secure this, Morgan thought it necessary to sail in the latitudes of Costa-Ricca, to procure some guides in the island of St Catharine's, where the Spaniards confined their malefactors. This place was so strongly fortified, that it ought to have held out for ten years against a considerable army. Notwithstanding this, the governor, on the first appearance of the pirates, sent privately to concert measures how he might surrender himself without incurring the imputation of cowardice. The result of this consultation was, that Morgan, in the night-time, should attack a fort at some distance, and the governor should fall out of the citadel to defend a post of so much consequence; that the assailants should then attack him in the rear, and take him prisoner, which would consequently occasion a surrender of the place. It was agreed that a smart firing should be kept on both sides, without doing mischief to either. This farce was admirably carried on. The Spaniards, without being exposed to any danger, appeared to have done their duty; and the bucaners, after having totally demolished the fortifications, and put on board their vessels a prodigious quantity of warlike ammunitions which they found at St Catharine's, steered their course towards the river Chagre, the only channel that was open to them to arrive at the place which was the object of their utmost wishes.

At the entrance of this considerable river, a fort was built upon a steep rock, which the waves of the sea constantly beat against. This bulwark, very difficult of access, was defended by an officer whose extraordinary abilities were equal to his courage, and by a garrison that deserved such a commander. The bucaners, for the first time, here met with a resistance that could only be equalled by their perseverance: it was a doubtful point, whether they would succeed or be obliged to raise the siege, when a lucky accident happened that proved favourable to their glory and their

Bucaneers. their fortune. The commander was killed, and the fort accidentally took fire: the besiegers then taking advantage of this double calamity, made themselves masters of the place.

Morgan left his vessels at anchor, with a sufficient number of men to guard them; and sailed up the river in his sloops for 33 miles, till he came to Cruces, where it ceases to be navigable. He then proceeded by land to Panama, which was only five leagues distant. Upon a large and extensive plain that was before the city, he met with a considerable body of troops, whom he put to flight with the greatest ease, and entered into the city, which was now abandoned. Here were found prodigious treasures concealed in the wells and caves. Some valuable commodities were also taken upon the boats that were left aground at low water; and in the neighbouring forests were also found several rich deposits.

Having burnt the city, they set sail with a great number of prisoners, who were ransomed a few days after; and came to the mouth of the Chagre with a prodigious booty.

In 1603, an expedition of the greatest consequence was formed by Van Horn, a native of Ostend, but who had served all his life among the French. His intrepidity would never let him suffer the least signs of cowardice among those who associated with him. In the heat of an engagement, he went about his ship; successfully observed his men; and immediately killed those who shrank at the sudden report of a pistol, gun, or cannon. This extraordinary discipline had made him become the terror of the coward, and the idol of the brave. In other respects, he readily shared with the men of spirit and bravery the immense riches that were acquired by so truly warlike a disposition. When he went upon these expeditions, he generally sailed in his frigate, which was his own property. But these new designs requiring greater numbers to carry them into execution, he took to his assistance Gramont, Godfrey, and Jonqué, three Frenchmen distinguished by their exploits; and Lawrence de Graff, a Dutchman, who had signalized himself still more than they. Twelve hundred bucaners joined themselves to these famous commanders, and sailed in six vessels for Vera Cruz.

The darkness of the night favoured their landing, which was effected at three leagues from the place, where they arrived without being discovered. The governor, the fort, the barracks, and the polls of the greatest consequence; every thing, in short, that could occasion any resistance, was taken by the break of day. All the citizens, men, women, and children, were shut up in the churches, whither they had fled for shelter. At the door of each church were placed barrels of gunpowder to blow up the building. A bucaner, with a lighted match, was to set fire to it upon the least appearance of an insurrection.

While the city was kept in such terror, it was easily pillaged; and after the bucaners had carried off what was most valuable, they made a proposal to the citizens who were kept prisoners in the churches, to ransom their lives and liberties by a contribution of 437,500 l. These unfortunate people, who had neither ate nor drank for three days, cheerfully accepted the terms that were offered them. Half of the money was paid the

same day: the other part was expected from the internal parts of the country; when there appeared on an eminence a considerable body of troops advancing, and near the port a fleet of 17 ships from Europe. At the sight of this armament, the bucaners, without any marks of surprize, retreated quietly, with 1500 slaves they had carried off with them as a trilling indemnification for the rest of the money they expected, the settling of which they referred to a more favourable opportunity.

Their retreat was equally daring. They boldly sailed through the midst of the Spanish fleet; which let them pass without firing a single gun, and were in fact rather afraid of being attacked and beaten. The Spaniards would not probably have escaped so easily, and with no other inconvenience but what arose from their fears, if the vessels of the pirates had not been laden with silver, or if the Spanish fleet had been freighted with any other effects but such merchandize as were little valued by these pirates.

A year had scarce elapsed since their return from Mexico, when on a sudden they were all seized with the rage of going to plunder the country of Peru. It is probable, that the hope of finding greater treasures upon a sea little frequented, than on one long exposed to piracies of this kind, was the cause of this expedition. But it is somewhat remarkable, that both the English and French, and the particular associations of these two nations, had projected this plan at the same time, without any communication, intercourse, or design of acting in concert with each other. About 4000 men were employed in this expedition. Some of them came by Terra-Firma, others by the straits of Magellan, to the place that was the object of their wishes. If the intrepidity of these barbarians had been directed, under the influence of a skilful and respectable commander, to one single uniform end, it is certain that they would have deprived the Spaniards of this important colony. But their natural character was an invincible obstacle to so rare an union; for they always formed themselves into several distinct bodies, sometimes even so few in number as ten or twelve, who acted together, or separated, as the most trilling caprice directed. Grogner, Léenyer, Picard, and Le Sage, were the most distinguished officers among the French: David, Samms, Peter, Wilner, and Towley, among the English.

Such of those adventurers as had got into the South Sea by the straits of Darien, seized upon the first vessels they found upon the coast. Their associates, who had sailed in their own vessels, were not much better provided. Weak however as they were, they beat several times the squadrons that were fitted out against them. But these victories were prejudicial to them, as they interrupted their navigation. When there were no more ships to be taken, they were continually obliged to make descents upon the coasts to get provisions, or to go by land in order to plunder those cities where the booty was secured. They successively attacked Seppa, Puebla-Nuevo, Leon, Realejo, Puebla-Viejo, Chiriquita, Lesparfo, Granada, Villia, Nicoya, Tecoanteca, Muemeluna, Chilotecca, New-Segovia, and Guayaquil, the most considerable of all these places.

Many of them were taken by surprize; and most of them deserted by their inhabitants, who fled at the

Bucaneers. fight of the enemy. As soon as they took a town, it was directly set on fire, unless a sum proportioned to its value was given to save it. The prisoners taken in battle were massacred without mercy, if they were not ransomed by the governor or some of the inhabitants: gold, pearls, or precious stones, were the only things accepted of for the payment of their ransom. Silver being too common, and too weighty for its current value, would have been troublesome to them. The chances of fortune, that seldom leave guilt unpunished, nor adversity without a compensation for its suffering, atoned for the crimes committed in the conquest of the new world, and the Indians were amply revenged of the Spaniards.

While such priacies were committed on the southern ocean, the northern was threatened with the same by Gramont. He was a native of Paris, by birth a gentleman, and had distinguished himself in a military capacity in Europe; but his passion for wine, gaming, and women, had obliged him to join the pirates. He was, however, affable, polite, generous, and eloquent: he was endued with a sound judgment, and was a person of approved valour; which soon made him be considered as the chief of the French bucaneeers. As soon as it was known that he had taken up arms, he was immediately joined by a number of brave men. The governor of St Domingo, who had at length prevailed upon his master to approve of the project, equally wise and just, of fixing the pirates to some place, and inducing them to become cultivators, was desirous of preventing the concerted expedition, and forbade it in the king's name. Gramont, who had a greater share of sense than his associates, was not on that account more inclined to comply, and sternly replied: "How can Louis disapprove of a design he is unacquainted with, and which has been planned only a few days ago?" This answer highly pleased all the bucaneeers; who directly embarked, in 1685, to attack Campeachy.

They landed without opposition. But at some distance from the coast, they were attacked by 800 Spaniards, who were beaten and pursued to the town; where both parties entered at the same time. The cannon they found there was immediately levelled against the citadel. As it had very little effect, they were contriving some stratagem to enable them to become masters of the place, when intelligence was brought that it was abandoned. There remained in it only a gunner; an Englishman; and an officer of such signal courage, that he chose rather to expose himself to the greatest extremities, than basely to fly from the place with the rest. The commander of the bucaneeers received him with marks of distinction, generously released him, gave him up all his effects, and besides complimented him with some valuable presents: such influence have courage and fidelity even on the minds of those who seem to violate all the rights of society.

The conquerors of Campeachy spent two months in searching all the environs of the city, for 12 or 15 leagues, carrying off every thing that the inhabitants, in their flight, thought they had preserved. When all the treasure they had collected from every quarter was deposited in the ships, a proposal was made to the governor of the province, who still kept the field with 900 men, to ransom his capital city. His refusal de-

termined them to burn it, and demolish the citadel. **Bucaneers.** The French, on the festival of St Louis, were celebrating the anniversary of their king; and in the transports of their patriotism, intoxication, and national love of their prince, they burnt to the value of a million of logwood; a part, and a very considerable one too, of the spoil they had made. After this singular and extravagant instance of folly, of which Frenchmen only could boast, they returned to St Domingo.

In 1697, 1200 bucaneeers were induced to join a squadron of seven ships that sailed from Europe under the command of Pointis, to attack the famous city of Carthagena. This was the most difficult enterprise that could be attempted in the new world. The situation of the port, the strength of the place, the badness of the climate, were so many obstacles that seemed insurmountable to any but such men as the bucaneeers were. But every obstacle yielded to their valour and good fortune: the city was taken, and booty gained to the amount of 1,750,000 l. Their rapacious commander, however, deprived them of the advantages resulting from their success. He scrupled not, as soon as they set sail, to offer 5250 l. for the share of those who had been the chief instruments in procuring him so considerable a spoil.

The bucaneeers, exasperated at this treatment, resolved immediately to board the vessel called the *Sceptre*, where Pointis himself was, and which at that time was too far distant from the rest of the ships to expect to be assisted by them. This avaricious commander was upon the point of being massacred, when one of the malecontents cried out: "Brethren, why should we attack this rascal? he has carried off nothing that belongs to us. He has left our share at Carthagena, and there we must go to recover it." This proposal was received with general applause. A savage joy at once succeeded that gloomy melancholy which had seized them; and without further deliberation, all their ships sailed towards the city.

As soon as they had entered the city without meeting with any resistance, they shut up all the men in the great church; and exacted payment of 218,750 l. the amount of their share of booty which they had been defrauded of; promising to retreat immediately upon their compliance, but threatening the most dreadful vengeance if they refused. Upon this, the most venerable priest in the city mounted the pulpit, and made use of the influence his character, his authority, and his eloquence gave him, to persuade his hearers to yield up without reserve all the gold, silver, and jewels they had. The collection, which was made after the sermon, not furnishing the sum required, the city was ordered to be plundered.

At length, after amassing all they could, these adventurers set sail; when unfortunately they met with a fleet of Dutch and English ships, both which nations were then in alliance with Spain. Several of the pirates were either taken or sunk, with all the cargo they had on board their ships; the rest escaped to St Domingo.

Such was the last memorable event in the history of the bucaneeers. The separation of the English and French, when the war, on account of the prince of Orange, divided the two nations: the successful means they both made use of to promote the cultivation of land

land among their colonies, by the assistance of these enterprising men; and the prudence they showed in fixing the most distinguished among them, and entrusting them with civil and military employments: the protection they were both under a necessity of affording to the Spanish settlements, which till then had been a general object of plunder: all these circumstances, and various others, besides the impossibility there was of supplying the place of these remarkable men, who were continually dropping off, concurred to put an end to a society as extraordinary as ever existed. Without any regular system, without laws, without any degree of subordination, and even without any fixed revenues, they became the astonishment of that age in which they lived, as they will be also of posterity.

BUCCELLARIUM, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition bread; though authors are somewhat divided as to their office and quality. Among the Visigoth, buccellarius was a general name for a client or vassal who lived at the expence of his lord. Some give the denomination to parasites in the courts of princes, some make them the body-guards of emperors, and some fancy they were only such as emperors employed in putting persons to death privately.

BUCCELLATUM, among ancient military writers, denotes camp-bread, or biscuit baked hard and dry, both for lightness and keeping. Soldiers always carried with them enough for a fortnight, and sometimes much longer, during the time that military discipline was kept up.

BUCCHINA, an ancient musical and military instrument. It is usually taken for a kind of trumpet; which opinion is confirmed by Festus, by his defining it a crooked horn, played on like a trumpet. Vegetius observes, that the buccina bent in a semicircle, in which respect it differed from the tuba or trumpet. It is very hard to distinguish it from the cornu or horn, unless it was something less, and not quite so crooked; yet it certainly was of a different species, because we never read of the cornu in use with the watch, but only the buccina. Besides, the sound of the buccina was sharper, and to be heard much farther than either the cornu or the tuba. In scripture, the like instrument, used both in war and in the temple, was called *ramus-hornus*, *kiren-jobel*, and *sopherath hagijobelim*.

This instrument was in use among the Jews to proclaim their feast-days, new-moons, jubilees, sabbatic years, and the like. At Lacedæmon, notice was given by the buccina when it was supper-time; and the like was done at Rome, where the grandees had a buccina blown both before and after they sat down to table. The sound of the buccina was called *buccinus*, or *bucinus*; and the musician who played on it was called *buccinator*.

BUCCHINUM, or **WHELK**, a genus of shell-fish belonging to the order of *vermes testaceæ*. This animal is one of the snail kind. The shell is univalve, spiral, and gibbous. The aperture is oval, ending in a small strait canal. Linnæus enumerates about 60 species, most of which are found in the southern seas. The six following are found in the British seas.

1. The *pullus*, or brown whelk, with five spires striated, waved, and tuberculated. Aperture wrink-

led; upper part replicated. Length five eighths of an inch.

2. The *nodatum*, or waved whelk, with seven spires, is spirally striated, and deeply and transversely undulated. Length three inches. Inhabits deep water.

3. The *striatum* has eight spires, with elevated striae, undulated near the apex. Length near four inches.

4. The *reticulatum*, with spires scarcely raised, and strongly reticulated, is of a deep brown colour, and of an oblong form. The aperture white, glossy, and denticulated. Size of a hazel nut.

5. The *minutum*, or small whelk, with five spires, striated spirally, ribbed transversely. Size less than a pea. Found also in Norway.

6. The *lappillus*, or mussy whelk, with about five spires; side of the mouth slightly toothed: a very strong thick shell, of a whitish colour. A variety yellow, or fasciated with yellow, on a white ground; or sulcated spirally, and sometimes reticulated. Length near an inch and an half. Inhabits, in a vast abundance, rocks near low-water mark. This is one of the British shells that produce the purple dye analogous to the *purpura* of the ancients. See **MUREX**.

The process of obtaining the English *purpura* is well described by Mr William Cole of Bristol, in 1684, in *Phil. Trans.* *abr.* ii. 820.

The shells, being harder than most other kinds, are to be broken with a smart stroke of a hammer, on a plate of iron or firm piece of timber (with their mouths downwards) so as not to crush the body of the fish within; the broken pieces being picked off, there will appear a white vein lying transversely in a little furrow or cleft next to the head of the fish, which must be digged out with the stiff point of a horse-hair pencil, being made short and tapering. The letters, figures, or what else shall be made on the linen, (and perhaps silk too), will presently appear of a pleasant light green colour; and if placed in the sun, will change into the following colours; (*i. e.* if in winter, about noon; if in summer, an hour or two after sun-rising, and so much before setting; for in the heat of the day in summer, the colours will come on so fast, that the succession of each colour will scarcely be distinguished.) Next to the light green, it will appear of a deep green; and in a few minutes, change into a sea-green; after which, in a few minutes more, it will alter to a watchet-blue; from that, in a little time more, it will be of a purple-red; after which (supposing the sun still shining), it will be of a very deep purple-red, beyond which the sun can do no more. But then, the last and most beautiful colour, after washing in scalding water and soap, will (the matter being again put into the wind or sun to dry) be of a fair bright crimson, or near to the prince's colour; which afterwards, notwithstanding there is no use of any styptic to bind the colour, will continue the same if well ordered; as I have found in handkerchiefs, that have been washed more than 40 times; only it will be somewhat allayed from what it was after the first washing. While the cloth so writ upon lies in the sun, it will yield a very strong and fetid smell, as if garlic and asafetida were mixed together."

BUCCHLEUGH, a village in the county of Selkirk in Scotland, from which the noble family of Scott have the title of Duke; and would likewise have been

Bucco
||
Bucer

duke of Monmouth, had it not been for the attainder, they being the lineal descendants of his Grace: they are now also heirs to the noble family of Montague in England.

BUCCO, the **BARBET**, in ornithology, a genus belonging to the order of picæ. The beak is cultrated, turned inwards, compressed on the sides, and emarginated on each side at the apex; and there is a long slit below the eyes. The nostrils are covered with feathers. The feet have four toes, two before and two behind. Linnæus mentions only one species, the *capensis*; but ornithologists enumerate several, either as such or as individuals, differing only in age or sex, all found in Asia, Africa, or the southern parts of America.

BUCENTAUR, a galeas, or large galley of the doge of Venice, adorned with fine pillars on both sides, and gilt over from the prow to the stern. This vessel is covered over head with a kind of tent, made of purple silk. In it the doge receives the great lords and persons of quality that go to Venice, accompanied with the ambassadors and counsellors of state, and all the senators seated on benches by him. The same vessel serves also in the magnificent ceremony of ascension-day, on which the duke of Venice throws a ring into the sea to espouse it, and to denote his dominion over the gulph of Venice.

BUCENTAUR is also the name of a ship, as great and as magnificent as that of the Venetians, built by order of the elector of Bavaria, and lanchod on a lake which is six leagues in length.

BUCEPHALA, or **BUCEPHALOS**, (anc. geog.) a town built by Alexander, on the west side of the Hydaspis, a river of the Hither India, in memory of his horse Bucephalus, which was killed in the action with Porus, after crossing that river. Others say, this horse died of age, 30 years old; and not in the battle, but some time after. His being branded or marked on the buttock with the head of an ox, gave rise to his name, (*Heiýchius*).—This generous animal, who had so long shared the toils and dangers of his master, had formerly received signal marks of royal regard. Having disappeared in the country of the *Uxii*, Alexander issued a proclamation, commanding his horse to be restored, otherwise he would ravage the whole country with fire and sword. This command was immediately obeyed. "So dear," says Arrian, "was Bucephalus to Alexander, and so terrible was Alexander to the Barbarians."

BUCER (Martin), one of the first authors of the reformation at Straßburgh, was born in 1491, in Alface; and took the religious habit of St Dominic, at seven years of age: but meeting afterward with the writings of Martin Luther, and comparing them with the Scriptures, he began to entertain doubts concerning several things in the Romish religion. After some conferences with Luther at Heidelberg in 1521, he adopted most of his sentiments; but in 1532 he gave the preference to those of Zuinglius. He assisted in many conferences concerning religion; and in 1548 was sent for to Augsbürg to sign the agreement between the Papists and Protestant, called the *interim*. His warm opposition to this project exposed him to many difficulties and hardships; the news of which reaching England, where his fame had already arrived,

Buceros.

Cranmer archbishop of Canterbury gave him an invitation to come over, which he readily accepted. In 1549, a handsome apartment was assigned him in the university of Cambridge, and a salary to teach theology. King Edward VI. had the greatest regard for him. Being told that he was very sensible of the cold of the climate, and suffered much for want of a German stove, he sent him 100 crowns to purchase one. He died of a complication of disorders in 1551; and was buried at Cambridge with great funeral pomp. Five years after, in the reign of queen Mary, his body was dug up, and publicly burnt, and his tomb demolished; but it was afterwards set up by order of queen Elizabeth. He composed many works, among which are commentaries on the evangelists and gospels.

BUCEROS, in ornithology, a genus belonging to the order of picæ. The beak is convex, cultrated, very large, and ferrated outwards: the fore-head is naked, with a bony gibbosity. The nostrils are behind the base of the beak. The tongue is sharp and short. The feet are of the *gressarii* kind, *i. e.* the toes are distinct from each other. There are four species of the *buceros*, *viz.* 1. The *bicornis*, with a flat bony fore-head, and two horns before. The body is black, and about the size of a hen; but the breast, belly, and thighs are white. There is a white spot on the wing; the tail is long, with ten black prime feathers, and the four outermost on each are white. The feet are greenish, with three toes before and one behind. It is a native of China, and called *calao* by Willoughby and other authors. The pied hornbill, described by Mr Latham (*Synops.* Vol. I. p. 349.) from a living specimen which came from the East Indies, the author supposes to be the same species, differing merely in sex or age. In size, it was a trifle bigger than a crow. The manners of this bird were peculiar: it would leap forwards or sideways with both legs at once like a magpie or jay, never walking: when at rest, it folded its head back between the wings: the general air and appearance was rather stupid and dull, though it would sometimes put on a fierce look if at any time it was surpris'd or the like: it would eat lettuce after bruiling it with its bill, and swallow raw flesh; as well as devour rats, mice, and small birds, if given to him: it had different tones of voice on different occasions; sometimes a hoarse sound in the throat, most like *oûck, oûck*; at other times very hoarse and weak, not unlike the clucking of a Turkey hen. This bird used to display the wings and enjoy itself in a warm sun, but shivered in the cold; and as the winter approached died, unable to bear the severity of the climate, so different to its nature. Another variety, the *calao* (*Phil. Transf.* vol. xxiii. p. 394), is about the size of a hen. It inhabits the Philippine islands, and has a cry more like that of a hog or a calf than of a bird. The *Gentoos* rank it among their gods, and pay worship to it. It lives altogether in woods, feeding on fruits, such as the Indian fig, also pistachios, &c. which it swallows whole; and after the external parts have been digested, it brings up the nuts again whole, without the kernels being anywise damaged or unfit for vegetation. 2. The *hydrocorax* or Indian crow of Ray, has a plain bony fore-head without any horns. The body is yellowish, and blackish below. It inhabits the Molucca

illes.

Buchan
Buchanan

isses. Willoughby observes, that it resembles our raven in the bill, but is red on the temples like some kinds of turkies; has wide nostrils and ill-favoured eyes; and that it feeds chiefly on nutmegs, whence its flesh is very delicate, and has a fine aromatic relish. This in its native places is frequently tamed, and is useful in destroying rats and mice in houses. 3. The rhinoceros, has a crooked horn in the fore-head joined to the upper mandible. It is a native of India. These birds are said to feed on flesh and carrion; and that they follow the hunters for the purpose of feeding on the entrails of the beasts which they kill; that they chase rats and mice, and after pressing them flat with the bill in a peculiar manner, tossing them up into the air, swallow them whole immediately on their descent. 4. The *nasutus*, has a smooth forehead. It is about the size of a magpye, and is a native of Senegal. These are very common at Senegal and other warm parts of the old continent, where they are called *tock*. They are very tame and foolish birds while young, inasmuch as to suffer themselves to be taken by the hand; but having learned experience with mature age, they then become rather shy. When taken young, they immediately become familiar; but are so stupid as not to feed of themselves, though food be offered to them, requiring it to be put into their mouths. In their wild state they feed on fruits, but when domesticated eat bread, and will swallow almost any thing that is offered to them.

BUCHAN, a county or district of Scotland, lying partly in the shire of Aberdeen and partly in that of Banff: it gives the title of earl to the noble and ancient family of Eiskine.

BUCHANAN (George), the best Latin poet of his time, perhaps inferior to none since the Augustan age, was born in February 1506. This accomplished scholar and distinguished wit was not descended of a family remarkable for its rank. He had no occasion for the splendor of ancestry. He wanted not a reflected greatness, the equivocal, and too often the only ornament of the rich and noble. The village of Kilmearn, in Stirling-shire, Scotland, was the place of his nativity; and the abject poverty in which his father died might have confined him to toil at the lowest employments of life, if the generosity of an uncle had not assisted him in his education, and enabled him to pursue for two years his studies at Paris. But that short space was scarcely elapsed, when the death of his benefactor made it necessary that he should return to his own country, and forsake, for a time, the paths of science.

He was yet under his 20th year, and surrounded with the horrors of indigence. In this extremity, he enlisted as a common soldier under John duke of Albany, who commanded the troops which France had sent to assist Scotland in the war it waged, at this period, against England. But nature had not destined him to be a hero. He was disgusted with the fatigues of one campaign; and, fortunately, John Major, then professor of philosophy at St Andrew's, hearing of his necessity and his merit, afforded him a temporary relief. He now became the pupil of John Maiz, a celebrated teacher in the same university, under whom he studied the subtilties of logic; and contracting an attachment

to his master, he followed him to Paris. There, after having encountered many difficulties, he was invited to teach grammar in the college of St Barbe. In this slavish occupation he was found by the earl of Castels; with whom, having remained five years at Paris, he returned into Scotland. He next acted as preceptor to the famous earl of Murray, the natural son of James V. But while he was forming this nobleman for public affairs, he found that his life was in danger; and from enemies, whose vindictive rage could suffer no abatement, and who would not scruple the most dishonourable means of gratifying it.

The scandalous lives of the clergy had, it seems, excited his indignation; and, more than reasoning or argument, had estranged him from the errors of Popery. The Franciscan monks, in return to the beautiful but poignant satires he had written against them, branded him with the appellation of *atheist*; a term which the religious of all denominations are too apt indiscriminately to lavish where they have conceived a prejudice; and, not satisfied with the outrage of abuse and calumny, they conspired his destruction. Cardinal Beaton gave orders to apprehend him, and bribed king James with a very considerable sum to permit his execution. He was seized upon accordingly; and the first genius of his age was about to perish by the halter, or by fire, to satisfy a malignant resentment, when, escaping the vigilance of his guards, he fled into England. Henry VIII. at all times the slave of caprice and passion, was then burning, on the same day, and at the same stake, the Lutheran and the Papist. His court did not suit a philosopher or a satirist. After a short stay, Buchanan crossed the sea to France; and, to his extreme disappointment, found, at Paris, cardinal Beaton, as ambassador from Scotland. He retired privately to Bourdeaux, dreading, perhaps, new misfortunes, and concerned that he could not prosecute his studies in obscurity and in silence. Here he met Andrew Govea, a Portuguese of great learning and worth, with whom he had formerly been acquainted during his travels, and who was now employed in teaching a public school. He disdained not to act as the assistant of his friend; and during the three years he resided at this place, he composed the tragedies which do him so much honour. It was here, also, that he wrote some of the most pleasant of those poems, in which he has rallied the muses, and threatened to forsake them, as not being able to maintain their votary. About this time, too, he presented a copy of verses to the emperor Charles V. who happened to pass through Bourdeaux.

His enemies, mean while, were not inactive. Cardinal Beaton wrote about him to the archbishop of Bourdeaux; and by every motive which a cunning and a wicked heart can invent, he invited him to punish the most pestifential of all heretics. The archbishop, however, was not so violent as the cardinal. On enquiring into the matter, he was convinced that the poet had committed a very small impropriety; and allowed himself to be pacified. But fortune was not long to continue her smiles. Andrew Govea being called by the king of Portugal, his master, to establish an academy at Coimbra, he intreated Buchanan to accompany him. He obtained his request; and had not been a

Buchanan.

Buchanan year in his own country, when he died, and left his associate exposed to the malice of his inveterate enemies the monks. They loudly objected to him, that he was a Lutheran; that he had written poems against the Franciscans; and that he had been guilty of the abominable crime of eating flesh in lent. He was confined to a monastery till he should learn what these men fancied to be religion: and they enjoined him to translate the Psalms of David into Latin verse; a task which every man of taste knows with what admirable skill and genius he performed.

On obtaining his liberty, he had the offer of a speedy promotion from the king of Portugal; the issue of which, his aversion to the clergy did not allow him to wait. He hastened to England; but the perturbed state of affairs during the minority of Edward VI. not giving him the promise of any lasting security, he set out for France. There he had not been long, when he published his *Jephtha*, which his necessities made him dedicate to the marshal de Brissac. This patron did not want generosity, and could judge of merit. He sent him to Piedmont, as preceptor to his son Timoleon de Cossi. In this employ he continued several years; and during the leisure it afforded him, he fully examined the controversies which now agitated Europe; and he put the last hand to many of the most admired of his smaller poems.

When his pupil had no longer any use for him, he passed into Scotland, and made an open profession of the reformed faith. But he soon quitted his native country for France; which appears to have been more agreeable to his taste. Queen Mary, however, having determined that he should have the charge of educating her son, recalled him: and till the prince should arrive at a proper age, he was nominated to the principality of St Andrew's. His success as James's preceptor is well known. When it was reproached to him, that he had made his majesty a pedant; "It is a wonder (he replied) that I have made so much of him." Mackenzie relates a story concerning his tutelage of his pedantic majesty, which is strongly expressive of Buchanan's character as a man of humour, and at the same time shows the degree of his veneration for royalty. The young king being one day at play with his fellow-pupil the master of Erskine, Buchanan, who was then reading, desired them to make less noise. Finding that they disregarded his admonition, he told his majesty, if he did not hold his tongue, he would certainly whip his breech. The king replied, he would be glad to see who would *hell the cat*, alluding to the fable. Buchanan, in a passion, threw the book from him, and gave his majesty a sound flogging. The old countess of Mar, who was in the next apartment, rushed into the room, and taking the king in her arms, asked how he dared to lay his hand on *the Lord's anointed*, "Madam (says Buchanan), I have whipped his a—; you may kiss it, if you please."

On the misfortunes which befel the amiable but imprudent Mary, he went over to the party of the earl of Murray; and at his earnest desire he was prevailed upon to write his "Detection," a work which his greatest admirers have read with regret. Having been sent with other commissioners to England, against his mistress, he was, on his return, rewarded with the abbacy of Crofs Raguel; made director to the chancery;

and some time after lord of the privy council and privy seal. He was likewise rewarded by queen Elizabeth with a pension of 100*l.* a-year. The twelve last years of his life he employed in composing his *History of Scotland*. After having vied with almost all the more eminent of the Latin poets, he contested with Livy and Sallust the palm of eloquence and political sagacity. But it is to be remembered with pain, that, like the former of these historians, he was not always careful to preserve himself from the charge of partiality. In the year 1582, he expired at Edinburgh, in the 76th year of his age.

Various writers who have mentioned this author, speak of him in very different language, according to their religious and political principles. From his works, however, it is evident, that, both as a Latin poet and prose writer, he hath rarely been equalled since the reign of Augustus; nor is he less deserving of remembrance as a friend to the natural liberties of mankind, in opposition to usurpation and tyranny. "The happy genius of Buchanan (says Dr Robertson), equally formed to excel in prose and in verse, more various, more original, and more elegant, than that of almost any other modern who writes in Latin, reflects, with regard to this particular, the greatest lustre on his country." To his memory an obelisk 100 feet high is at this time (1788) erecting by subscription, at Killearn the place of his nativity, designed by Mr J. Craig nephew to the celebrated poet Thomson.

The following is a list of his works. 1. *Rerum Scotticarum, &c.* 2. *Psalms of David paraphrased poetica.* 3. *De jure regni apud Scotos dialogus.* 4. *Psalms civ. cum judicio Barclaii, &c.* 5. *Psalms cxx. cum analysi organica Beuzeri.* 6. *Baptistes, sive calumnia.* 7. *Alcestis, tragedia.* 8. *Tragedia sacra, et extera.* 9. *De Caeto recepto carmen, apud Stephan.* 10. *Franciscanus et Fratres, &c.* 11. *Elegia, Sylvia, &c.* 12. *De sphaera Herborna.* 13. *Poemata.* 14. *Satyra in cardinalem Lotharingium.* 15. *Rudimenta grammatices, Tho. Linacri ex Anglico sermone in Latinum verse.* 16. An admonition to the true lords. 17. *De prosodia.* 18. *Chameleon, 1572.* 19. *Ad viros sui seculi epistole.* 20. *Literæ reginæ Scotticæ ad com. Bothwelliæ.* 21. A detection of the doings of Mary queen of Scots, and of James earl of Bothwell, against Henry lord Darnly. 22. *Vita ab ipso scripta biennis ante mortem, cum commentario D. Rob. Sibbaldi, M. D.* 23. Life of Mary queen of Scots. These have been severally printed often, and in various countries. An edition of them all collected together was printed at Edinburgh in 1704, in 2 vols folio.

BUCHANNESS, a cape or promontory of Scotland, which is the farthest point of Buchan, not far from Peterhead, and the most eastern of all Scotland. E. Long. 0. 30. N. Lat. 57. 28.

BUCHAW, a free and imperial town of Germany, in Snabia, seated on the river Tedersee, 22 miles south-west of Ulm. Here is a monastery, whose abbels has a voice in the diets of the empire. E. Long. 9. 37. N. Lat. 48. 5.

BUCHAW, a small territory of Germany, in the circle of the Upper Rhine, which comprehends the district of the abbot of Flud.

BUCHOREST, a pretty large town of Turkey, in Europe, seated in the middle of Walachia, and the ordinary

BUCHOM, a small, free, and imperial town of Suabia in Germany, seated on the lake of Constance, in E. Long. 9. 20. N. Lat. 47. 41.

BUCIOCHE, in commerce, a sort of woollen cloth manufactured in Provence in France, which the French ships carry to Alexandria and Cairo.

BUCK, in zoology, a male horned beast of venery or chase, whose female is denominated a *doe*. See **CERVUS**, and *Buck-Hunting*.

BUCK, is also applied to the males of the hare and rabbit kind. See **LEPUS**, and *Hare-Hunting*.

Buck-Bean, in botany. See **MENYANTHES**.

Buck-Thorn, the English name of the **RHAMNUS**.

Buck-Wheat. See **POLYGONUM**.

BUCKENHAM (New), a town of Norfolk in England, which formerly had a strong castle, but now demolished. It is seated in a flat, in E. Long. 1. 10. N. Lat. 52. 30.

BUCKET, a small portable vessel to hold water, often made of leather for its lightness and easy use in cases of fire.—It is also the vessel let down into a well, or the sides of ships, to fetch up water.

BUCKING, the first operation in the whitening of linen yarn or cloth. See **BLEACHING**.

BUCKINGHAM, the chief town of Buckinghamshire in England, stands in a low ground, on the river Ouse, by which it is almost surrounded, and over which there are three handsome stone-bridges. The town is large and populous, sends two members to parliament, and had the title of a duchy. It seems, however, to have been but an inconsiderable place at the conquest; for, according to Doomsday-book, it paid only for one hide, and had but 26 burghesses. Edward the elder fortified it in the year 918 against the incursions of the Danes, with a rampart and turrets. It also had formerly a castle in the middle of the town, of which no vestiges now remain. The shrine of St Rumbald, the patron of fishermen, preserved in the church, was held in great veneration. The county goal stands in this town, and here the assizes are sometimes kept. It was formerly a staple for wool, but that advantage it hath now lost. It is governed by a bailiff and 12 burghesses, who are the sole electors of the members. In its neighbourhood are many paper-mills upon the Ouse. W. Long. 0 58. N. Lat. 51. 30.

Buckingham-Shire (supposed to derive its name from the Saxon word *Buc*, denoting a hart or buck),

an inland county of England. During the time prior to the landing of the Romans it was included in the division of Catiuchlani; and after their conquest it was included in their third province of Flavia Caesariensis. During the heptarchy it belonged to the kingdom of Mercia, which commenced in 582, and terminated in 827, having had 18 kings; and it is now included in the Norfolk circuit, the diocese of Lincoln, and the province of Canterbury. It is bounded on the north by Northamptonshire; south by Berkshire; east by Bedfordshire, Hertfordshire, and Middlesex; and west by Oxfordshire. It is of an oblong form, whose greatest extent is from north to south. It contains 441,000 acres, has above 111,400 inhabitants, 185 parishes, 73 vicarages, is 39 miles long, 18 broad, and 109 in circumference. It has 15 market towns, viz. Buckingham and Aylesbury the county towns, Marlow, Newport Pagnel, Winslow, Wendover, Beaconsfield, Wiccomb, Chesham, Amersham, Stony Stratford, Colnbrook, Ivingho, Oalsey, Risborough; besides the considerable villages of Eaton and Fenny Stratford, and 613 others inferior. It is divided into eight hundreds, provides 560 men for the militia, sends 14 parliament-men, and pays 12 parts of the land-tax. Its rivers are the Thames, Ouse, Coln, Wicham, Amersham, Ila, Tame, and Loddon. Its chief produce is bone-lace, paper, corn, fine wool, and breeding rams. The most noted places are the Chiltern Hills, Vale of Aylebury, Burnwood-Forest, Wooburn-Heath, and 15 parks. The air is generally good, and the soil mostly chalk or male.

BUCKINGHAM (George Villiers duke of). See **VILLIERS**

BUCKINGHAM (John Sheffield duke of). See **SHEFFIELD**.

BUCKLE, a well known utensil, made of divers sorts of metals, as gold, silver, steel, brass, &c.

The fashion or form of buckles is various; but their use, in general, is to make fast certain parts of dress, as the shoes, garters, &c.

BUCKLE, in heraldry. The buckle was so much esteemed in former times, that few persons of repute and honour wore their girdle without it; and it may be considered, in coats of arms, as a token of the surety, the faith, and service of the bearer.

BUCKLER, a piece of defensive armour used by the ancients. It was worn on the left arm; and composed of wickers woven together, or wood of the lightest sort, covered with hides, and fortified with plates of brass or other metal. The figure was sometimes round, sometimes oval, and sometimes almost square. Most of the bucklers were curiously adorned with all sorts of figures of birds and beasts, as eagles, lions; nor of these only, but of the gods, of the celestial bodies, and all the works of nature; which custom was derived from the heroic times, and from them communicated to the Grecians, Romans, and Barbarians.

The scutum, or Roman buckler, was of wood, the parts being joined together with little plates of iron, and the whole covered with a bull's hide. An iron plate went about it without, to keep off blows; and another within, to hinder it from taking any damage by lying on the ground. In the middle was an iron boss or *umbo* jutting out, very serviceable to glance off stones and darts; and sometimes to press violently upon the

Votive
Bucklers
||
Buda.

the enemy, and drive all before them. They are to be distinguished from the clypei, which were less, and quite round, belonging more properly to other nations, though for some little time used by the Romans. The scuta themselves were of two kinds; the *ovata*, and the *imbricata*: the former is a plain oval figure; the other oblong, and bending inward like half a cylinder. Polybius makes the scuta four feet long, and Plutarch calls them *rostratus, reaching down to the feet*. And it is very probable that they covered almost the whole body, since in Livy we meet with soldiers who stood on the guard, sometimes sleeping with their head on their shield, having fixed the other part of it in the earth.

Votive BUCKLERS: Those consecrated to the gods, and hung up in their temples, either in commemoration of some hero, or as a thanksgiving for a victory obtained over an enemy; whose bucklers, taken in war, were offered as a trophy.

BUCKOR, a province of Asia, subject to the great mogul. It is seated on the river Indus, on the banks of which there are coin and cattle; but the west part, which is bounded by Sagestan in Persia, is a desert. The inhabitants are strong, robust, and apt to mutiny; for which reason the mogul has a garrison at the chief town, called *Buckor*, which is seated in an island made by the river Indus. They are all Mahometans, and drive a great trade in cotton cloth, and other Indian commodities. E. Long. 70. 5. N. Lat. 28. 20.

BUCKRAM, in commerce, a sort of coarse linen cloth stiffened with glue, used in the making of garments to keep them in the form intended. It is also used in the bodies of womens gowns; and it often serves to make wrappers to cover cloths, serges, and such other merchandises, in order to preserve them and keep them from the dust, and their colours from fading. Buckrams are sold wholesale by the dozen of small pieces or remnants, each about four ells long, and broad according to the piece from which they are cut. Sometimes they use new pieces of linen cloth to make buckrams, but most commonly old sheets and old pieces of sails.

BUCKSTALL, a toil to take deer, which must not be kept by any body that has not a park of his own, under penalties.

BUCOLIC, in ancient poetry, a kind of poem relating to shepherds and country affairs, which, according to the most generally received opinion, took its rise in Sicily. Bucolics, says Vossius, have some conformity with comedy. Like it, they are pictures and imitations of ordinary life; with this difference, however, that comedy represents the manners of the inhabitants of cities, and bucolics the occupations of country people. Sometimes, continues he, this last poem is in form of a monologue, and sometimes of a dialogue. Sometimes there is action in it, and sometimes only narration; and sometimes it is composed both of action and narration. The hexameter verse is the most proper for bucolics in the Greek and Latin tongues. Moschus, Bion, Theocritus, and Virgil, are the most renowned of the ancient bucolic poets.

BUD, in botany. See the article GEMMA.

BUDA, the capital city of Hungary, called *Ofen* by the inhabitants, and *Buden* by the Turks. It is large, well fortified, and has a castle that is almost im-

pregnable. The houses are tolerably handsome, being most of them built with square stone. It was a much finer place before the Turks had it in their possession; but they being masters of it 135 years, have suffered the finest buildings to fall to decay. The lower city, or Jews town, extends like suburbs from the upper city to the Danube. The upper town takes up all the declivity of a mountain; and is fortified with good walls, which have towers at certain distances. The castle, which is at the extremity of the hill, on the east side, and commands the greatest part of it, is surrounded with a very deep ditch, and defended by an old-fashioned tower, with the addition of new fortifications. There is also a suburb, inclosed with hedges, after the Hungarian manner. The most sumptuous structures now are the caravaneras, the mosques, bridges, and baths. These last are the finest in Europe, for the magnificence of the building, and plenty of water. Some of the springs are used for bathing and drinking; and others are so hot, that they cannot be used without a mixture of cold water. The Danube is about three quarters of a mile in breadth; and there is a bridge of boats between this city and Peil, consisting of 63 large pontoons. The Jews have a synagogue near the castle-gardens. The adjacent country is fruitful and pleasant, producing rich wines; though in some places they have a sulphureous flavour.

This city was the residence of the Hungarian monarchs till the Turks took it in 1526. Ferdinand archduke of Austria recovered it the next year; but in 1529 the Turks became masters of it again. In 1684 the Christians laid siege to it; but they were obliged to raise it soon after, though they had an army of 80,000 men. Two years after, the Turks lost it again, it being taken by assault in the sight of a very numerous army. The booty that the Christians found there was almost incredible, because the rich inhabitants had lodged their treasury in this city as a place of safety. However, part of these riches were lost in the fire occasioned by the assault. This last siege cost the Christians a great deal of blood, because there were many in the camp who carried on a secret correspondence with the Turks. When the seraskier saw the city on fire, and found he could not relieve it, he beat his head against the ground for anger. In 1687, this city had like to have fallen into the hands of the Turks again, by treachery. After this, the Christians augmented the fortifications of this place, to which the Pope contributed 100,000 crowns, for this is looked upon as the key of Christendom. It is seated on the Danube, 105 miles south-east of Vienna, 63 north by west of Belgrade, and 563 north-west of Constantinople. E. Long. 19. 22. N. Lat. 47. 20.

BUDA (the beglerbeglic of), was one of the chief governments of the Turks in Europe. It included all the countries of Upper Hungary between the rivers Teisse and Danube, and between Agria and Novi-grad all Lower Hungary, from Gran and Canisca, the eastern part of Sclavonia, and almost all Servia: but a good part of this government now belongs to the queen of Hungary.

BUDÆUS (William), the most learned man in France in the 15th century, was descended of an ancient and illustrious family, and born at Paris in 1467.

Buda
||
Budæus.

Buddaus
||
Budding.

He was plac'd young under masters; but barbarism prevailed so much in the schools of Paris, that Bodæus took a dislike to them, and spent his whole time in idleness, till his parents sent him to the university of Orleans to study law. Here he pass'd three years without adding to his knowledge; for his parents sending for him back to Paris, found his ignorance no less than before, and his reluctance to study, and love to gaming and other useful pleasures, much greater. They talk'd no more to him of learning of any kind; and as he was heir to a large fortune, left him to follow his own inclinations. He was passionately fond of hunting, and took great pleasure in horses, dogs, and hawks. The fire of youth beginning to cool, and his usual pleasures to pall upon his senses, he was seiz'd with an irresistible passion for study. He immediately dispos'd of all his hunting equipage, and even abstracted himself from all business to apply himself wholly to study; in which he made, without any assistance, a very rapid and amazing progress, particularly in the Latin and Greek languages. The work which gain'd him greatest reputation was his treatise *de Affe*. His erudition and high birth were not his only advantages; he had an uncommon share of piety, modesty, gentleness, and good-breeding. The French king Francis I. often sent for him; and at his persuasion, and that of Du Bellay, founded the royal college of France, for teaching the languages and sciences. The king sent him to Rome with the character of his ambassador to Leo X. and in 1522 made him master of requests. The same year he was chosen provost of the merchants. He died at Paris in 1540. His works, making four volumes in folio, were printed at Basil in 1557.

BUDDÆUS (John Francis), a celebrated Lutheran divine, and one of the most learned men Germany has produced, was born in 1667, at Anclam, a town of Pomerania, where his father was minister. He was at first Greek and Latin professor at Colburg; afterwards professor of morality and politics in the university of Hall; and at length, in 1705, professor of divinity at Jena, where he fix'd, and where he died, after having acquired a very great reputation. His principal works are, 1. A large historical German dictionary. 2. *Historia ecclesiastica Veteris Testamenti*, 2 vols. 4to. 3. *Elementa philosophiæ practiciæ, instrumentalis, et theoreticæ*, 3 vols. 8vo, which has had a great number of editions, because, in most of the universities of Germany, the professors take this work for the text of their lessons. 4. *Selecta juris nature et gentium*. 5. *Miscellanea sacra*, 3 vols. 4to. 6. *Spargæ historico-theologica ad theologiam univ'ersam, singularisque ejus partes*, 2 vols. 4to; which is much valued by the Lutherans. 7. A treatise on atheism and superstition.

BUDDSDALE, or **BETTISDALE**, a town of Suffolk in England, seated in a dale or valley, and its street takes in a good part of Ricking, all which together make up the town, for of itself it is but a hamlet, having a small chapel, and an endowed grammar-school, to which belong certain scholarships, assigned to Bennet or Corpus Christi-college in Cambridge, being the gift of Sir Nicholas Bacon, lord keeper of the great seal. E. long. 1. 8. N. Lat. 52. 25.

BUDDING, in gardening. See **ENGRAITING**.

VOL. III. Part II.

BUDDLE, in mineralogy, a large square frame of boards, used in washing the tin ore.

BUDDLEIA, in botany: a genus of the monogyria order, belonging to the tetrandria class of plants. The calyx and corolla are quadrifid; the stamina plac'd at the incisures of the corolla. The capsule is bifurcated, bilocular, and polyspermous. There are two species, viz. the americana, and occidentalis. The first is a native of Jamaica and most of the other American islands; where it rises to the height of ten or twelve feet, with a thick woody stem covered with a grey bark; and sends out many branches towards the top, which come out opposite: at the ends of the branches the flowers are produced in long close spikes branching out in clusters, which are yellow, consisting of one leaf cut into four segments; these are succeeded by oblong capsules filled with small seeds. The second grows naturally at Carthage; and rises much higher than the other, dividing into a great number of slender branches covered with a russet hairy bark, garnish'd with long spear-shaped leaves ending in sharp points: at the end of the branches are produced branching spikes of white flowers growing in whorls round the stalks, with small spaces between each.— These plants grow in gullies, or other low sheltered spots; their branches being too tender to resist the force of strong winds. They may be propagated by seeds procur'd from those places where they are natives; and are to be managed like other exotics: only their seeds must be sown in pots as soon as they arrive, and very lightly covered; for if they are buried deep in the earth, they will all perish.

BUDELICH, a town of Germany, in the electoral circle of the Rhine and archbishopric of Treves, seated on the little river Traen, in E. Long. 6. 55. N. Lat. 49. 52.

BUDGE-BARRELS, among engineers, small barrels well hoop'd, with only one head; on the other end is nail'd a piece of leather, to draw together upon strings like a pufe. Their use is for carrying powder along with a gun or mortar; being less dangerous, and easier carried, than whole barrels. They are likewise used upon a battery of mortars, for holding meal-powder.

BUDGE (Eustace), Esq; an ingenious and polite writer, was the son of Gilbert Budge, doctor of divinity; and was born at St Thomas, near Exeter, about the year 1685. He was educated at Christ-church college, Oxford; from which he removed to the Inner Temple, London; but instead of studying the law, for which his father intended him, he apply'd to polite literature; kept company with the genteel persons in town; and particularly contracted a strict intimacy with the ingenious Mr Addison, who was first cousin to his mother, and who, on his being made secretary to lord Wharton lord lieutenant of Ireland, took him with him as one of the clerks of his office. Mr Budge, who was about 20 years of age, and had read the classics, and the works of the best English, French, and Italian authors, now became concern'd with Sir Richard Steele and Mr Addison in writing the Tatler, as he had, soon after, a share in writing the Spectator, where all the papers written by him are mark'd with an X; and when that work was completed, he had likewise a hand in the Guardian, where his performances are mark'd with an asterisk.

Budgell

risk. He was afterwards made under-secretary to Mr Addison, chief secretary to the lords justices of Ireland, and deputy-clerk of the council. Soon after, he was chosen member of the Irish parliament; and in 1717, Mr Addison, having become principal secretary of state in England, procured him the place of accountant and comptroller general of the revenue in Ireland. But the next year, the duke of Bolton being appointed lord-licutenant, Mr Budgell wrote a lampoon against Mr Webster, his secretary, in which his Grace himself was not spared; and upon all occasions treated that gentleman with the utmost contempt. This imprudent step was the primary cause of his ruin: for the Duke of Bolton, in support of his secretary, got him removed from the post of accountant-general; upon which, returning to England, he, contrary to the advice of Mr Addison, published his case in a pamphlet, intitled, "A letter to the lord * * *", from Huitace Budgell, Esq; accountant-general," &c. Mr Addison had now resigned the seals, and was retired into the country for the sake of his health: Mr Budgell had also lost several other powerful friends, who had been taken off by death; particularly the lord Halifax and the earl of Sunderland: he, however, made several attempts to succeed at court, but was constantly kept down by the duke of Bolton. In the year 1720 he lost 20,000*l.* by the South-sea scheme, and afterwards spent 5000*l.* more in unsuccessful attempts to get into Parliament. This completed his ruin. He at length employed himself in writing pamphlets against the ministry, and wrote many papers in the Craftsman. In 1733, he began a weekly pamphlet, called *The Bee*; which he continued for above 100 numbers, printed in eight volumes 8vo. During the progress of this work, Dr Tindal's death happened, by whose will Mr Budgell had 2000*l.* left him; and the world being surpris'd at such a gift from a man entirely unrelated to him, to the exclusion of the next heir, a nephew, and the continuator of Rapin's history of England, immediately imputed it to his making the will himself. Thus the satyriss;

Let Budgell charge low Grub-street on my quill,
And write whate'er he please, except my will.

It was thought he had some hand in publishing Dr Tindal's *Christianity as old as the creation*; for he often talked of another additional volume on the same subject, but never published it. After the cessation of the Bee, Mr Budgell became so involved in law-suits, that he was reduced to a very unhappy situation. He got himself called to the bar, and attended for some time in the courts of law; but finding himself unable to make any progress, and being distressed to the utmost, he determin'd at length to make away with himself. Accordingly, in the year 1736, he took a boat at Somerset-stairs, after filling his pockets with stones; ordered the waterman to shoot the bridge; and, while the boat was going under, threw himself into the river. He had several days before been visibly distracted in his mind. Upon his bureau was found a slip of paper, on which were these words:

What Cato did, and Addison approv'd,
Cannot be wrong.

Besides the above works, he wrote a Translation of

Theophrastus's Characters. He was never married; but left one natural daughter, who afterwards assumed his name, and became an actress in Drury-lane.

BUDINUS (anc. geog.), a mountain of Sarmatia Europæa, from which the more northern spring of the Boryithenes is said to take its rise, according to Ptolemy. But this is contradicted by later accounts. Now *Potsilia*.

BUDNÆANS, in ecclesiastical history, so called from the name of their leader, Simon Budnæus. They not only denied all kind of religious worship to Jesus Christ, but asserted, that he was not begotten by any extraordinary act of divine power; being born, like other men, in a natural way. Budnæus was deposed from his ministerial functions in the year 1584, and publicly excommunicated, with all his disciples; but afterwards abandoning his peculiar sentiments, he was readmitted to the communion of the Socinian sect. Crellius ascribes the origin of the above opinion to Adam Neuser.

BUDOA, a maritime town of Dalmatia, with a bishop's see, subject to the Venetians. It is seated between the gulf of Cattaro and the city of Dulugno, on the coast of Albany; and is an important fortress, where the Venetians always keep a strong garrison. In 1667, it suffered greatly by an earthquake: and in 1685 was besieged by Soliman, basha of Scutari; but general Cornaro obliged him to raise the siege. E. long. 19. 22. N. lat. 42. 12.

BUDRIO, a town of Italy, in the Bolognese. The adjacent fields produce large quantities of fine hemp, which renders the town of more consequence than larger places. E. long. 11. 35. N. lat. 44. 27.

BUDUN, is the name of one of the Ceylonesse gods: he is supposed to have arrived at supremacy, after successive transmigration from the lowest state of an insect, through the various species of living animals. There have been three deities of this name, each of which is supposed to reign as long as a bird removes a hill of sand, half a mile high, and six miles round, by a single grain in a thousand years. See SAKRADAWENDRA.

BUDWEIS, a royal city of Bohemia, in Germany. It is pretty large and well built, surrounded with strong walls, fortified with a good rampart, and might be made an important place. It was taken by the king of Prussia in 1744, but he did not keep it very long. E. long. 14. 19. N. lat. 42. 15.

BUDZIAC TARTARY, lies on the rivers Neister, Bog, and Nieper; having Poland and Russia on the north, Little Tartary on the east, the black sea on the south, and Bessarabia on the west. The chief town is Oczakow. It is subject to Turkey.

BUENA VISTA, one of the Cape de Verd islands, lying in N lat. 15. 56. It is also called *Bonvista*, and *Bonnevue*; but the first is the true appellation, the others being only abbreviations and corruptions of the original name, which signifies a *good prospect*, intimating the beautiful appearance it makes to ships at sea. This island is reckoned near 20 leagues in circumference, and is distinguished on the north side by a ridge of white rocks that bound it. The coast that stretches east and north-west is terminated with fundry banks to the sea; but the interior part is chiefly mountainous. From the northern point there is a large ridge

Budinus
||
Buena.

Buenos
||
Buff.

ridge of rocks projecting near a whole league into the sea, against which the waves break with incredible fury. Another point of rocks stretches into the sea on the southern point of the island eastward, a league and a half beyond that point; and in that bay is the best road for shipping.

BUENOS AYRES, a country of South America, belonging to the Spaniards. This name, given from the pleasantness of the climate, is extended to all that country lying between Tucuman on the east, Paraguay on the north, and Terra Magellanica on the south, or to the vertex of that triangular point of land which composes South America. The country is watered by the great river La Plata; first discovered in 1515 by Juan Diaz de Solis, who with two of his attendants was massacred by the natives; and partly subdued by Sebastian Gaboto, who gave the great river the appellation of *La Plata*, from the abundance of the precious metals he procured from the inhabitants, imagining them to be the produce of the country, though in fact they were brought from Peru—No country in the world abounds more in horned cattle and horses than Buenos Ayres, where the greatest expence of a horse or cow is in the catching it, and they are frequently to be had at the small price of two or three rials. In such abundance are these useful animals, that the hide alone is deemed of any value, as this constitutes a main article in the trade of the country. All rove wild in the fields; but they are now become more difficult of access, the terrible havoc made among them having taught the cautious brutes to keep at a greater distance. All kinds of fish are in the same abundance; the fruits produced by every quarter of the globe grow up here in the utmost perfection; and for the enjoyment of life, and the salubrity of the air, a finer country cannot be imagined. The principal cities are Buenos Ayres the capital, Monte Video, Corienteo, and Santa Fe.

Buenos Ayres (Nuestra Señora de), the capital of the country called *Buenos Ayres*, in South America, was founded in the year 1535, under the direction of Don Pedro de Mendoza, at that time governor. It stands on a point called *Cape Blanco*, on the south side of the Plata, fronting a small river, on S. Lat. 34° 34'. 38'. according to the observations of Father Feuille. The situation is in a fine plain, rising by a gentle ascent from the river; and truly paradisaical, whether we regard the temperature of the climate, the fertility of the soil, or that beautiful verdure which overspreads the whole face of the country, of which the inhabitants have a prospect as far as the eye can reach. The city is very considerable in extent, containing 3000 houses, inhabited by Spaniards and others of different complexions. The streets are straight, broad, and pretty equal in the heights and dimensions of the buildings; one very handsome square adorns it, the front being a castle in which the governor holds his court, and presides over a garrison of 3000 soldiers. Most of the buildings are of chalk or brick, except the cathedral, a magnificent structure, composed chiefly of stone.

BUFALMACO (Boramico), an Italian painter; the first who put labels to the mouths of his figures, with sentences; since followed by bad masters, but more frequently in caricatura engravings. He died in 1340.

BUFF, in commerce, a sort of leather prepared from

the skin of the buffalo; which dressed with oil, after the manner of shammy, makes what we call *buff-skin*. This makes a very considerable article in the French, English, and Dutch commerce at Constantinople, Smyrna, and all along the coast of Africa. The skins of elks, oxen, and other like animals, when prepared after the same manner as that of the buffalo, are likewise called *buff*.

Of buff skin, or buff-leather, are made a sort of coats for the horse or *gens d'armes* of France, bandaliers, belts, pouches, and gloves.

In France, there are several manufactories designed for the dressing of those sorts of hides, particularly at Corbeil, near Paris; at Niort, at Lyons, at Rone, at Etanepus, at Cone.

BUFFALO, in zoology. See Bos.

BUFFET was anciently a little apartment, separated from the rest of the room by slender wooden columns, for the disposing of china, glass-ware, &c.

It is now properly a large table in a dining-room, called also a *file-board*, for the plate, glasses, bottles, basons, &c. to be placed on, as well for the service of the table as for magnificence. In houses of persons of distinction in France, the buffet is a detached room, decorated with pictures relative to the subject, with fountains, cisterns, and vases. It is commonly faced with marble or bronze.

BUFFIER (Claude), a French writer, in 1661, became a Jesuit in 1679, and died at Paris in 1737. There are many works of this author, which shew deep penetration and accurate judgment; the principal of which is, "Un Cours des Sciences," &c. that is, a Course of Sciences upon principles new and simple, in order to form language, the understanding, and the heart, 1732," in folio. This collection includes an excellent "French grammar upon a new plan; a philosophic and practical treatise upon eloquence; an art of poetry," which however is not reckoned the best part of this miscellany; "elements of metaphysics; an examination into vulgar prejudices; a treatise of civil society; and an exposition of the proofs of religion;" all full of reflections, just as well as new. He was the author of other works, in verse and prose, of which no great account is had; and it is remarkable, that his style in both is rather easy than accurate and correct, notwithstanding the precepts in his "grammar," which is really philologic.

BUFFON (Count de). See CLEGG.

BUFFOON, a droll, or mimic, who diverts the public by his pleasantries and follies. Menage, after Salmassius, derives the word from *buffs*; a name given to those who appeared on the Roman theatre with their cheeks blown up; that, receiving blows thereon, they might make the greater noise, and set the people a laughing. Others, as Rhodiginus, makes the origin of buffoonery more venerable; deriving it from a least indited in Attica by K. Erichtheus, called *buffonia*.

Buffoons are the same with what we otherwise find denominated *juvencs, gelastari, mimici, rursilli, goliardi, jocularres*, &c. whose chief scene is laid at the tables of great men. Gallienus never sat down to meat without a second table of buffoons by him; Tillemont also renders *partemimus* by buffoons. In which sense he observes, the shows of the buffoons were taken

away by Domitian, restored by Nerva, and finally abolished by Trajan.

BUFONIA, TOAD-GRASS: A genus of the monogynia order, belonging to the diandria class of plants; and in the natural method ranking under the 22d order, *Sarzophyllac.* The calyx is quinque-dentate; there is no corolla; the berry is monospermous. There is but one species, *viz.* the tenuifolia, a native of Britain.

BUFONITA, in natural history, the toad-stone. This has been received not only among the list of native stones by the generality of authors, but even has held a place among the gems, and is still worn in rings by some people; though undoubtedly it is an extraneous fossil. There has been a strong opinion in the world, that it was found in the head of an old toad; and that this animal voided it at the mouth, on being put on a red cloth. The general colour of the bufonite is a deep dusky brown; but it varies greatly in this respect in several specimens, some of which are quite black, others of an extremely pale, simple brown, a chestnut colour, liver colour, black, grey, or whitish. The bufonites are usually found immersed in beds of stone; and so little doubt is there of what they have originally been, *viz.* the petrified teeth of the lupus piscis, or wolf-fish, that part of the jaw of the fish has sometimes been found with the teeth petrified in it. The bufonites are said to be cordial and astringent: many other fanciful virtues are ascribed to them, which the present practice has rejected.

BUG, or BUGG, in zoology, the English name of a species of cimex. See **CIMEX.**

Cheap, easy, and clean mixture for effectually destroying Bugs. Take of the highest rectified spirit of wine, (*viz.* lamp-spirits) that will burn all away dry, and leave not the least moisture behind it, half a pint; new distilled oil, or spirit, of turpentine, half a pint: mix them together; and break into it, in small bits, half an ounce of camphire, which will dissolve it in a few minutes: shake them well together; and with a piece of sponge, or a brush dipt in some of it, wet very well the bed or furniture wherein those vermin harbour and breed, and it will infallibly kill and destroy both them and their nits, although they swarm ever so much. But then the bed and furniture must be well and thoroughly wet with it (the dust upon them being first brushed and shook off), by which means it will neither soil, stain, nor in the least hurt, the finest silk or damask bed that is. The quantity here ordered of this mixture (that costs but about a shilling) will rid any one bed whatever, tho' it swarms with bugs. If any bugs should happen to appear after once using it, it will only be for want of well wetting the lacing, &c. of the bed, or the folding of the linens or curtains near the rings, or the joints or holes in and about the bed or head-board, wherein the bugs and nits nestle and breed; and then their being wetted all again with more of the same mixture, which dries in as fast as you use it, pouring some of it into the joints and holes where the brush or sponge cannot reach, will never fail absolutely to destroy them all. Some beds that have much wood-work can hardly be thoroughly cleared without being first taken down; but others that can be drawn out, or that you can get well behind, to be done as it should be, may. The smell this mixture occasions will be all gone in two or three days; which yet is very wholesome, and to many people agreeable.

Remember always to shake the mixture together very well, whenever you use it, which must be in the day-time, not by candle-light, lest the subtlety of the mixture should catch the flame as you are using it, and occasion damage.

Early in the spring, even in February, the larva of these creatures begins to burst from the egg; and it is at this season that attention is so very requisite. The bed ought to be stripped of all its furniture; which should be washed, and even boiled, if linen; if stuff, it should be hot-pressed. The bed-head should be taken to pieces, dated, and washed with spirit of wine in the joints; for in those parts the females lay their eggs. This done, the joints, crevices, cavities, &c. should be well filled with the best soft soap mixed with verdigris and Scots snuff. On this substance the larva, if any escape the cleansing, or any, which is common in old houses, creep into the bed-head, will feed at first, and of course be destroyed: this last will effect the purpose in houses where these vermin are not so numerous, by repeating the operation every three months.—Professor Kalm † mentions, that, from repeated trials, he has been convinced that sulphur, if it be properly employed, entirely destroys bugs and their eggs in beds or walls, though they were ten times more numerous than the ants on an ant-hill. His translator, Dr Forster, adds, that a still more effectual remedy is, to wash all the infested furniture with a solution of arsenic. See further the article **CIMICIFUGA.**

BUGEY, a province of France, bounded on the east by Savoy, on the west by Bresse, on the south by Dauphiny, and on the north by the territory of Gex and the Franche Comte. It is about 40 miles long and 25 broad. Though it is a country full of hills and rivers, yet it is fertile in some places, the rivers abound with trouts, and there are plenty of all sorts of game. The chief places are Belley the capital, Seifel, St Rambert, Fort l'Ecluse, and Chateau-Neuf.

BUGGERS, *Bulgari,* anciently signified a kind of heretics, otherwise called *Paterini, Cathari,* and *Albigenses.*

The word is formed of the French *Bugres,* and that from *Bougria* or *Bulgaria,* the country where they chiefly appeared. Among other errors, they held, that men ought to believe no scripture but the New Testament; that baptism was not necessary to infants; that husbands who conversed with their wives could not be saved; and that an oath was absolutely unlawful. They were strenuously refuted by Fr. Robert, a Dominican, surnamed the *Bugger,* as having formerly made profession of this heresy.

The Buggers are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugares.* *Circa dies autem illos incubat heretica pravitas eorum qui vulgariter dicuntur Paterini & Bugares, de quorum erroribus malo tacere quam loqui.*

BUGGER, or BUGGERER, came afterwards to be used for a Sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at least practised, this abominable crime.

BUGGER (Bulgarius) is also a denomination given to usurers; usury being a vice to which the same heretics are said to have been much addicted.

BUGGERY, or SODOMY, is defined by Sir Edward Coke to be a carnal copulation against nature, either

ther by a confusion of species, that is to say, either a man or woman with a brute beast; or sexes, as a man with a man, or a man unnaturally with a woman. It is said this sin against God and nature was first brought into England by the Lombards. As to its punishment, the voice of nature and of reason, and the express law of God †, determine it to be capital. Of this we have a signal instance, long before the Jewish dispensation, by the destruction of two cities by fire from heaven; so that this is an universal, not merely a provincial, precept. Our ancient law, in some measure, imitated this punishment, by commanding such miscreants to be burnt to death; though Fleta says, they should be buried alive; either of which punishments was indifferently used for this crime among the ancient Goths. But now the general punishment of all felonies is the same, namely, by hanging: and this offence (being in the times of Popery only subject to ecclesiastical censures) was made felony without benefit of clergy by statute 25 Hen. VIII. c. 6. revived and confirmed by 5 Eliz. c. 17. And the rule of law herein is, that, if both parties are arrived at the years of discretion, *agones et consentientes pari pena plectantur*, "both are liable to the same punishment."

BUGIA, a province of the kingdom of Algiers in Africa. It is almost surrounded with mountains; and is divided into three parts, Benjubar, Amaz, and Labez. These mountains are peopled with the most ancient Arabs, Moors, or Saracens. The province is very fertile in corn.

BUGIA, by the Africans called *Bugeiah*, a maritime town of Africa, in the kingdom of Algiers, and once the capital of the province of that name. It is supposed to be the *Sallic* of Strabo, built by the Romans. It hath a handsome port formed by a narrow neck of land running into the sea; a great part of whose promontory was formerly faced with a wall of hewn stone; where was likewise an aqueduct, which supplied the port with water, discharging it into a capacious basin; all which now lie in ruins. The city itself is built on the ruins of a large one, at the foot of a high mountain that looks towards the north-east; a great part of whose walls run up quite to the top of it; where there is also a castle that commands the whole town, besides two others at the bottom, built for a security to the port. The inhabitants drive a considerable trade in ploughshares, mattocks, and other iron tools, which they manufacture from the neighbouring mines. The town is watered by a large river, supposed to be the *Nafava* of Ptolemy. The place is populous, and hath a considerable market for iron work, oil, and wax, which is carried on with great tranquillity; but is no sooner over than the whole place is in an uproar, so that the day seldom concludes without some flagrant instance of barbarity. E. Long. 4. N. Lat. 35. 30.

BUGLE, a town of Egypt, situated on the western shore of the Red Sea almost opposite to Ziden, the port-town to Mecca, and about 100 miles west of it. E. Long. 36. N. Lat. 22. 15.

BUGLE, in botany. See **AJUGA**.

BUGLOSS, in botany. See **ASCHUSA**.

Vipers Bugloss, in botany. See **ECHINUM**.

BUILDING, a fabric erected by art, either for devotion, magnificence, or conveniency.

BUILDING is also used for the art of constructing and

raising an edifice; in which sense it comprehends as well the expences as the invention and execution of the design. See **ARCHITECTURE**.

The modern buildings are much more commodious, as well as beautiful, than those of former times. Of old they used to dwell in houses, most of them with a blind stair-case, low ceilings, and dark windows; the rooms built at random, without any thing of contrivance, and often with steps from one to another; so that one would think the people of former ages were afraid of light and fresh air: whereas the genius of our times is altogether for light stair-cases, fine fash-windows, and lofty ceilings. And such has been our builders industry in point of compactness and uniformity, that a house after the new way will afford, on the same quantity of ground, almost double the conveniences which could be had from an old one.

By act 11 Geo. I. and 4 Geo. III. for the regulation of building within the weekly bills of mortality, and in other places therein specified, party walls are required to be erected of brick or stone, which shall be two bricks and a half thick in the cellar, two bricks thick upwards to the garret floor, &c. and other limitations are enacted respecting the disposition of the timbers, &c. And every building is to be surveyed; and the person who offends against the statute in any of the particulars recited, is liable to a forfeit of 250 l. to be levied by warrant of justices of the peace. The other principal statutes relating to building are 19 Car. II. c. 3. 22 Car. II. c. 11. 5 Eliz. c. 4. 35 Eliz. c. 6. 6 Ann. c. 31. 7 Ann. c. 17. 33 Geo. II. c. 30. and 6 Geo. III. c. 37.

Building of Ships. See **SHIP-BUILDING**.

BUILTPI, or **BEALT**, a town of South-Wales in Brecknockshire, pleasantly seated on the river Wye, over which there is a wooden bridge that leads into Radnorshire. W. Long. 3. 10. N. Lat. 52. 8.

BUIS, a territory of France, in Dauphiny. It is a small mountainous country, but pretty fertile; and Buis and Nions are the principal places.

BUKARI, a small well built town of Hungarian Dalmatia, situated on the Golfo di Bkeriza, in E. Long. 20. 51. N. Lat. 45. 20.

BUKHARIA, a general name for all that vast tract of land lying between Karazm and the *great Kobi*, or sandy desert bordering on China. It derives its name of *Bukharia* from the mogul word *Bukhar*, which signifies a learned man; it being formerly the custom for those who wanted instruction in the languages and sciences to go into Bukharia. Hence this name appears to have been given to it by the Mogul, who under Jenghiz Khan conquered the country. It is nearly the same with that called by the Arabs *Mascerahali*, which is little other than a translation of the word *Transoxana*, the name formerly given to these provinces.

This region is divided into Great and Little Bukharia.

Great Bukharia (which seems to comprehend the *Sogdiana* and *Bactriana* of the ancient Greeks and Romans with their dependencies) is situated between the 34th and 46th degrees of north latitude, and between the 76th and 92d degrees of east longitude. It is bounded on the north by the river *Sir*, which separates it from the dominions of the *Eluts* or Kalmuck: and

Bukharia.

the kingdom of *Kabghar* in Little Bukharia, on the east; by the dominions of the great Mogul and Persia on the south; and by the country of Karazm on the west: being about 770 miles long from west to east, and 730 miles broad from south to north. It is an exceeding rich and fertile country; the mountains abound with the richest mines; the valleys are of an astonishing fertility in all sorts of fruit and pulse; the fields are covered with grass the height of a man; the rivers abound with excellent fish; and wood, which is scarce over all Grand Tartary, is here in great plenty. But all these benefits are of little use to the Tartar inhabitants, who are naturally so lazy, that they would rather go rob and kill their neighbours, than apply themselves to improve the benefits which nature so liberally offers them. This country is divided into three large provinces, *viz.* Bukharia proper, Samarcand, and Balk; each of which generally has its proper khan. The province of Bukharia proper is the most western of the three; having on the west Karazm, on the north a desert called by the Arabs *Gaznah*, on the east the province of Samarcand, and on the south the river Amu. It may be about 390 miles long, and 120 broad. The towns are Bokhara, Zam, Wardansi, Karakul, Siunjbala, Karthi, Zarju, Nersem, Karmina, &c.

Little Bukharia is so called, not because it is less in dimensions than the other, for in reality it is larger; but because it is inferior to it as to the number and beauty of its cities, goodness of the soil, &c. It is surrounded by deserts: it has on the west, Great Bukharia; on the north, the country of the Kalmucks; on the east, that of the Moguls subject to China; on the south, Thibet, and the north-west corner of China. It is situated between the 93d and 118th degrees of east longitude, and between 35°. 30' and 45° of north latitude; being in length from east to west about 850 miles, and in breadth from north to south 580; but if its dimensions be taken according to its semicircular course from the south to the north-east, its length will be 1200 miles. It is sufficiently populous and fertile; but the great elevation of its land, joined to the height of the mountains which bound it in several parts, particularly towards the south, renders it much colder than from its situation might naturally be expected. It is very rich in mines of gold and silver; but the inhabitants reap little benefit by them, because neither the Eluths nor Kalmucks, who are masters of the country, nor the Bukhars, care to work in them. Nevertheless, they gather abundance of gold from the beds of the torrents formed by the melting of the snow in the spring; and from hence comes all that gold dust which the Bukhars carry into India, China, and Siberia. Much musk is likewise found in this country; and all sorts of precious stones, even diamonds; but the inhabitants have not the art of either cutting or polishing them.

The inhabitants both of Great and Little Bukharia, are generally those people called *Bukhars*. They are commonly sun-burned and black-haired; although some of them are very fair, handsome, and well made. They do not want politeness, and are addicted to commerce; which they carry on with China, the Indies, Persia, and Russia: but those who deal with them will be sure of being over-reached, if they do not take great care. The

Bukharia.

habits of the men differ very little from those of the Tartars. Their girdles are like those of the Poles. The garments of the women differ in nothing from those of the men, and are commonly quilted with cotton. They wear bobs in their ears, 12 inches long; and twist their hair in tresses, which they lengthen with black ribbands embroidered with gold or silver, and with great tassels of silk and silver, which hang down to their heels; three other tufts of a smaller size cover their breasts. Both sexes carry about with them prayers written by their priests, which they keep in a small leathern purse by way of relics. The girls, and some of the women, tinge their nails red with the juice of an herb called by them *kera*: they dry and pulverize it; then mixing it with powder-alum, expose it in the air for 24 hours before they use it, and the colour lasts a long time. Both sexes wear close breeches, and boots of Russia leather, very light, and without heels, or leather soles; putting on galloches, or high-heeled slippers like the Turks, when they go abroad. They wear also the same sort of bonnets and covering for the head; only the women set off theirs with tinkets, small pieces of money, and Chinese pearls. Wives are distinguished from maids by a long piece of linen worn under their bonnets; which folding round the neck, they tie in a knot behind, so that one end of it hangs down to the waist.

The Bukhar houses are of stone, and pretty good; but their moveables consist mostly of some China trunks plated with iron. Upon these, in the day-time, they spread the quilts they have made use of at night, and cover them with a cotton carpet of various colours. They have likewise a curtain sprigged with flowers and various figures; also a sort of bedstead half a yard high, and four yards long, which is hidden in the day-time with a carpet. They are very neat about their victuals; which are dressed in the mailer's chamber by his slaves, whom the Bukhars either take or buy from the Russians, Kalmucks, or other neighbours. For this purpose there are in the chamber, according to the largeness of the family, several iron pots, set in a kind of range near a chimney. Some have little ovens, made, like the rest of the walls, with a stiff clay or bricks. Their utensils consist of some plates and porringers made of Cagua wood or of China, and some copper vessels. A piece of coloured calico serves them instead of a table-cloth and napkins. They use neither chairs nor tables, knives nor forks; but sit cross-legged on the ground; and the meat being served up, they pull it to pieces with their fingers. Their spoons resemble our wooden ladles. Their usual food is minced meats, of which they make pies of the form of a half-moon: these serve for provision when the Bukhars go long journeys, especially in winter. They carry them in a bag, having first exposed them to the frost; and when boiled in water, they make very good broth. Tea is their common drink, of which they have a black sort prepared with milk, salt, and butter; eating bread with it, when they have any.

As the Bukhars buy their wives, paying for them more or less according to their handiomeness; so the surest way to be rich is to have many daughters. The persons to be married must not see or speak to each other from the time of their contract to the day of marriage. This is celebrated with three days feasting,

as

Bukharia as they do great annual festivals. The evening before the wedding, a company of young girls meet at the bride's house, and divert themselves till midnight, playing, dancing, and singing. Next morning the guests assemble, and help her to prepare for the ceremony. Then, notice being given to the bridegroom, he arrives soon after, accompanied by ten or twelve of his relations and friends. These are followed by some playing on flutes, and by an *Abu* (a kind of priest), who sings, while he beats two little timbrels. The bridegroom then makes a horse-race; which being ended, he distributes the prizes, six, eight, or twelve, in number, according to his ability. They consist of damasks, fables, fox-skins, calico, or the like. The parties do not see each other while the marriage ceremony is performing, but answer at a distance to the questions asked by the priest. As soon as it is over, the bridegroom returns home with his company; and after dinner carries them to the bride's house, and obtains leave to speak to her. This done, he goes back, and returns again in the evening, when he finds her in bed; and, in presence of all the women, lays himself down by her in his cloaths, but only for a moment. The same farce is acted for three days successively; but the third night he passes with her entirely, and the next day carries her home.

Although the prevailing religion throughout all Little Bukharia is the Mahometan, yet all others enjoy a perfect toleration. The Bukhars say that God first communicated the koran to mankind by Moses and the prophets; that afterwards Mahomet explained, and drew a moral from it, which they are obliged to receive and practise. They hold Christ to be a prophet, but have no notion of his sufferings. Yet they believe in the resurrection, but cannot be persuaded that any mortal shall be eternally damned: on the contrary, they believe, that as the dæmons led them into sin, so the punishment will fall on them. They believe moreover, that at the last day every thing but God will be annihilated; and, consequently, that all creatures, the devils, angels, and Christ himself, will die. Likewise, that, after the resurrection, all men, excepting a few of the elect, will be purified or chastised by fire, every one according to his sins, which will be weighed in the balance. They say there will be eight different paradises for the good; and seven halls, where sinners are to be purified by fire: that those who will suffer most, are liars, cheats, and others of that kind; that the elect who do not feel the fire will be chosen from the good; *viz.* one out of 100 men, and one out of 1000 women; which little troop will be carried into one of the paradises, where they shall enjoy all manner of felicity, till it shall please God to create a new world. It is a sin, according to them, to say, that God is in heaven. God, say they, is every where; and therefore it derogates from his omnipresence to say that he is confined to any particular place. They keep an annual fast of 30 days, from the middle of July to the middle of August, during which time they taste nothing all day; but eat twice in the night, at sun-set and midnight; nor do they drink any thing but tea, all strong liquors being forbidden. Whoever transgresses these ordinances is obliged to emancipate his most valuable slave, or to give an entertainment to 60 people: he is likewise to receive 85 strokes on the back with a leather strap

called *dura*. The common people, however, do not observe this fast exactly, and workmen are allowed to eat in the day-time. The Bukhars say prayers five times a day; before morning, towards noon, afternoon, at sun-set, and in the third hour of the night.

Jenghis Khan, who conquered both the Bukharias from the Arabs, left the empire of them to his son Jagatay Khan. He died in the year 1240, and left the government to his son Kara Kulaku, and of Little Bukharia to another called *Amal Kazy Khan*. A long succession of khans is enumerated in each of these families, but their history contains no interesting particulars. They are long since extinct, and the Kalmuck Tartars are masters of the country.

BUL, in the ancient Hebrew chronology, the eighth month of the ecclesiastical, and the second of the civil year; it has since been called *Marchesvan*, and answers to our October.

BULAC, a town of Egypt, situated on the eastern shore of the river Nile, about two miles west of Grand Cairo, of which it is the port town, and contains about 4000 families. It is a place of great trade, as all the vessels going up and down the Nile make some stay here. It is also at this place that they cut the banks of the river every year, in order to fill their canals and overflow the neighbouring grounds, without which the soil would produce neither grain nor herbage. *L. Long.* 32. *N. Lat.* 30.

BULAFU, a musical instrument, consisting of several pipes of wood tied together with thongs of leather, so as to form a small interstice between each pipe. It is used by the negroes of Guinea.

BULARCHUS, a Greek painter; the first who introduced (among the Greeks at least) different colours in the same picture. He flourished 740 B. C.

BULB, in the anatomy of plants, a kind of large bud, generally produced under the ground, upon or near the root of certain herbaceous plants, hence denominated *bulbeus*.

A bulb is defined by Linnæus to be a species of hybernaculum, produced upon the descending caudex or root; consisting of stipule, petioli, the rudiments of the former leaves, and scales or bark.

To elucidate this definition, it is proper to remark, that every bud contains, in miniature or embryo, a plant, in every respect similar to the parent plant upon which it is seated. Plants therefore are perpetuated in the buds, as well as in the seeds; and the species may be renewed with equal efficacy in either way.

The tender rudiments of the future vegetable of which the bud is composed, are enclosed, and during the severities of winter defended from cold and other external injuries, by a hard bark or rind which generally consists of a number of scales placed over each other like tiles, and fastened together by means of a tannation, resinous, and frequently odiferous, substance. Thus defended, the buds remain upon different parts of the mother plant, till the ensuing spring; and are, therefore, with great propriety, denominated by Linnæus the *hybernacula* or winter-quarters of the future vegetable.

With respect to their place, buds are situated either upon the stem and branches, or upon the roots: the former are styled *gemme*, or buds properly so called; but as they subsist several years by their roots, may be furnished

Bulb.

furnished with the other species of *hybernaculum*, called *bulbs*, which, according to the definition, are seated upon the descending *caudex* or root.

Again, trees which are perennial, with a woody and durable stem or trunk, have generally proper buds or gemmæ, but no bulbs.

In bulbous plants, as the tulip, onion, or lily, what we generally call the *root*, is in fact a bulb or *hybernaculum*, which incloses and secures the embryo or future shoot.

At the lower part of this bulb may be observed a fleshy knob or tubercle, from whence proceed a number of fibres or threads. This knob, with the fibres attached to and hanging from it, is, properly speaking, the true root; the upper part being only the cradle or nursery of the future stem, which after the bulb has repaired a certain number of times, it perishes; but not till it has produced at its sides a number of smaller bulbs or suckers for perpetuating the species.

One part of Linnæus's definition still remains obscure. The bulb, says he, is composed of the remains or rudiments of the former leaves of the plant; *e rudimento foliorum præteritorum*.

It is easy to comprehend that buds contain the rudiments of the future leaves: but how can bulbs be said to contain the rudiments of leaves that, to all appearance, are already perished? To explain this, let it be observed, that, in the opinion of very eminent botanists, the root, in a very great number of perennial herbs, is annually renewed or repaired out of the trunk or stalk itself: in which sense only, roots are properly said to descend.

In the perennials alluded to, the basis of the stalk continually, and by insensible degrees, descends below the surface of the earth, and is thus changed into a true root; which root, by the continuance of the said motion of the stalk, also descends; and thus, according to the durability of its substance, becomes a longer or shorter root: the elder or lower part rotting off in proportion as the upper is generated out of the stalk. Thus, in brownwort, the basis of the stalk, sinking down by degrees till it is hid under the ground, becomes the upper part of the root; and continuing still to sink, the next year becomes the lower part, and the following year rots away.

This is exactly what obtains in bulbous roots, as well as in the far greater number of other herbaceous perennials, as acorn, valerian, tansy, samphire, primrose, woodsorrel, iris, and others.

The immediate visible cause of this descent is the string-roots which this kind of trunks frequently puts forth: which descending themselves directly into the ground, serve like so many ropes for pulling the trunk after them. Hence the tuberous roots of iris are sometimes observed to reascend a little upon the rotting or fading away of the string-roots which hang at them.

In bulbous roots, where the stalk and former leaves of the plant are sunk below, and formed into what is called the *bulb* or wintering of the future vegetable, the radicles or small fibres that hang from the bulb are to be considered as the root; that is, the part which furnishes nourishment to the plant: the several kinds and shells whereof chiefly the bulb consists, successively

perish, and shrink up into so many dry skins; betwixt which, and in their centre, are formed other leaves and shells, and thus the bulb is perpetuated.

What has been said of the descent of roots by the sinking of the stalk, is further confirmed by the appearance of certain roots; as of valerian, plantago major, and devil's-bit, in which the lower part appears bitten or chopped off. In these the lower part rotting off as the upper descends, the living remainder becomes stumped, or seems bitten.

All bulbous roots, says the learned Dr Grew in his anatomy of plants, may be considered as hermaphrodite roots, or root and trunk both together: for the radicles or strings only are absolute roots; the bulb actually containing those parts which springing up make the body or leaves of the plant; so that it may be regarded as a large bud under ground.

Bulbous roots are said to be solid, when composed of one uniform lump of matter: tunicated, when formed of multitudes of coats surrounding one another; squamose, when composed of, or covered with, lesser flakes; duplicate, when there are only two to each plant; and aggregate, when there is such a congeries of such roots to each plant.

BULBOCASTANUM, in botany. See **BULBIUM**.

BULBOCODIUM, **MOUNTAIN-SAFFRON**: A genus of the monogynia order, belonging to the hexandria class of plants; and, in the natural method, ranking under the 9th order, *Spathaceæ*. The corolla is funnel-shaped, and hexapetalous, with the heels narrow, supporting the stamina. There are two species, the alpinum and vernal. The first sort grows naturally on the Alps, and also on Snowdon in Wales. It hath a small bulbous root, which sends forth a few long narrow leaves somewhat like those of saffron, but narrower. In the middle of these the flower comes out, which stands on the top of the footstalk, growing erect, and is shaped like those of the crocus, but smaller; the foot-stalk rises about three inches high, and hath four or five short narrow leaves placed alternately upon it below the flower. This flowers in March, and the seeds are ripe in May. The second is a native of Spain. It hath a bulbous root shaped like those of the snow-drop, which sends out three or four spear-shaped concave leaves, between which comes out the flower, standing on a very short footstalk. The flowers appear about the same time with the last; at first they are of a pale colour, but afterwards change to a whitish purple. These plants may be propagated by off-sets at the decay of the flower and leaf every second or third year; also, by sowing the seed in pots in autumn, sheltering them in a frame from frost; and the plants will appear in the spring, which, at the decay of the leaves, may be taken up for planting in the borders in October, where they will flower the year following.

BULBOSE, or **BULBOUS**. See **BULB**.

BULEUTÆ, in Grecian antiquity, were magistrates answering to the decuriones among the Romans. See **DECURIO**.

BULFINCH, in ornithology. See **LOXIA**.

BULGARIA, a small province of Turkey in Europe, bounded on the north by Wallachia, on the east by the Black sea, on the south by Romania and Macedonia,

Bulbeca-

Bulgaria
Balk.

Bull.

cedonia, and on the west by Servia. It is very narrow, but 325 miles long on the side of the Danube, from Servia till it falls into the Black sea.

The Bulgarians anciently inhabited the plains of Sarmatia that extended along the banks of the Volga. Thence they migrated, about the middle of the 7th century of the Christian era, in quest of new settlements. A large body of them passed the Danube, and took possession of the country adjacent to the western coast of the Euxine sea. Several attempts were made by the Romans to dispossess and extirpate them: But they defended themselves with equal resolution and success. Constantine III. being defeated and intimidated, concluded an ignominious peace with them (A. D. 678), and purchased their friendship by the payment of an annual tribute. Justinian II. refused to comply with these dishonourable terms, and invaded their territories (A. D. 687); but he was defeated, and constrained to renew the treaty. War was carried on, almost without interruption, between them and the eastern emperors, during the course of several centuries. After a long and doubtful struggle, the Romans prevailed; and the emperor Basil reduced Bulgaria to the form of a province (A. D. 1019). From this time the Bulgarians remained in subjection, and were governed by Roman dukes, until the reign of Isaac Angelus, when they revolted (A. D. 1186).

The history of Bulgaria, in the subsequent period, scarcely merits attention. Stephen IV. king of Hungary, having defeated the Bulgarians, obliged them to acknowledge him as their sovereign. His successors were styled kings of Hungary and Bulgaria; and this title was transmitted, together with the kingdom of Hungary, to the house of Austria.

By the aid of the eastern emperors they threw off the Hungarian yoke; and, in return, they assisted their ally in an attempt to recover Adrianople (A. D. 1369). Provoked by this combination, Amurath invaded their country; and Bajazet, his successor, completed the conquest of it (A. D. 1396).

Bulgaria still remains a province of the Ottoman empire. The inhabitants are Christians; but extremely ignorant, inasmuch that they seem to know nothing of Christianity but baptism and fasting. It is divided into four sangiacates; Byden, Sardice, Nicopolis, and Silistria. The chief towns are of the same names, except Sardice, which is now called *Sophia*.

BULGARIAN Language, the same with the *SLAVONIC*.

BULIMY, a disease in which the patient is affected with an insatiable and perpetual desire of eating; and, unless he is indulged, he often falls into fainting fits. It is also called *fames canina*, canine appetite. See *MEDICINE-Index*.

BULITHUS, a stone found either in the gall-bladder, or in the kidneys and bladder, of an ox. See *Bos*.

BULK of a SHIP, the whole content in the hold for the stowage of goods.

Bulk-Heads are partitions made athwart the ship with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, and several other divisions. The *bulk-head afore* is the partition between the fore-castle and gratings in the head.

VOL. III. Part II.

BULL (Dr John), a celebrated musician and composer, was born in Somersetshire about the year 1563, and, as it is said, was of the Somerset family. He was educated under Blitheman. In 1586, he was admitted at Oxford to the degree of bachelor of music, having practised in that faculty 14 years; and in 1592, was created doctor in the university of Cambridge. In 1596, he was appointed organist of the queen's chapel, in the room of his master, Blitheman.

Bull was the first Gresham professor of music, and was appointed to that station upon the special recommendation of queen Elizabeth. However skilful he might be in his profession, it seems he was not able to read his lectures in Latin; and therefore, by a special provision in the ordinances respecting the Gresham professors, made anno 1597, it is declared, that because Dr Bull is recommended to the place of music-professor by the queen's most excellent majesty, being not able to speak Latin, his lectures are permitted to be altogether English, so long as he shall continue music-professor there.

In the year 1601, he went abroad for the recovery of his health, which at that time was declining; and during his absence was permitted to substitute, as his deputy, a son of William Bird, named *Thomas*. He travelled incognito into France and Germany; and Wood takes occasion to relate a story of him while abroad, which the reader shall have in his own words.

"Dr Bull hearing of a famous musician belonging to a cathedral in St Omer's, he applied himself, as a novice, to him, to learn something of his faculty, and to see and admire his works. This musician, after some discourse had passed between them, conducted Bull to a vestry or music-school adjoining to the cathedral, and shewed him a lesson or song of 40 parts; and then made a vaunting challenge to any person in the world to add one part more to them, supposing it to be so complete and full, that it was impossible for any mortal man to correct or add to it. Bull thereupon, desiring the use of pen, ink, and ruled paper, such as we call *musical paper*, prayed the musician to lock him up in the said school for two or three hours; which being done, not without great disdain by the musician, Bull, in that time or less, added 40 more parts to the said lesson or song. The musician thereupon being called in, he viewed it, tried it, and retired it; at length he burst out into a great cessary, and swore by the great God, that he that added these 40 parts must either be the devil or Dr Bull. Whereupon Bull making himself known, the musician fell down and adored him. Afterwards, continuing there and in those parts for a time, he became so much admired, that he was courted to accept of any place of preferment suitable to his profession, either within the dominions of the emperor, the king of France, or Spain; but the tidings of these transactions coming to the English court, queen Elizabeth commanded him home." *Esq.*, anno 1586.

Dr Ward, who has given the life of Dr Bull, in his lives of the Gresham professors, relates, that upon the decease of queen Elizabeth he became chief organist to king James, and had the honour of entertaining his majesty and prince Henry at Merchant Taylor's hall with his performance on the organ. The same author proceeds to relate, that in 1613 Bull quitted Eng-

Bull.

land and went to reside in the Netherlands, where he was admitted into the service of the archduke. He suggests, as the reason of Bull's retirement, that the science began to sink in the reign of king James; which he infers from that want of court-patronage, which, it seems, induced the musicians of that day to dedicate their works to one another. But surely Bull had none of these reasons to complain of being slighted that others had. He was in the service of the chapel, and at the head of the prince's musicians; and in the year 1604 his salary for the chapel-duty had been augmented. The circumstances of his departure from England may be collected from the following entry now to be seen in the cheque book: "1613, John Bull doctor of music went beyond seas without licence, and was admitted into the archduke's service, and entered into paie there about Mich. and Peter Hopkins a base from Paul's was sworn into his place the 27th of December following. His wages from Mich. unto the day of the swearing of the said Peter Hopkins was disposed of by the deane of his majesty's chapel." Wood says, that Dr Bull died at Hamburg: others have said at Lubeck.

The only works of Bull in print are lessons in the "Parthenia, or the maiden-head of the first music that ever was printed for the virginals." An anthem of his, "Deliver me, O God," is to be found in Bernard's collection of church-music. Dr Ward has given a long list of compositions of Dr Bull in manuscript in the collection of the late Dr Pepusch, by which it appears that he was equally excellent in vocal and instrumental harmony. By some of the lessons in the Parthenia it seems that he was possessed of a power of execution on the harpsichord far beyond what is generally conceived of the masters of that time. As to his lessons, they were, in the estimation of Dr Pepusch, not only for the harmony and contrivance, but for air and modulation, so excellent, that he scrupled not to prefer them to those of Couperin, Scarlatti, and others of the modern composers for the harpsichord.

BULL (George), bishop of St David's, was born at Wells, in 1634; and educated at Exeter college, in Oxford. The first benefice he enjoyed was that of St George's, near Bristol, whence he rose successively to be rector of Suddington in Gloucestershire, prebendary of Gloucester, archdeacon of Llandaff, and in 1705 bishop of St David's. This dignity he enjoyed about four years, and died in 1709. During the usurpation of Cromwell, he adhered steadily, though still with great prudence, to the forms of the church of England; and in the reign of James II. preached very strenuously against the errors of Popery. He wrote, 1. A defence of the Nicene faith. 2. Apostolical harmony. 3. Primitive apostolical tradition; and other works.

BULL, in zoology. See **BOS**.

Wild BULLS. The wild bulls now so numerous on the continent of America, are said to have sprung from one bull and seven cows, which were carried thither by some of the first conquerors. For the manner of hunting these, see **BUCANEERS**.

BULL, in astronomy. See **ASTRONOMY**, n° 406.

BULL'S-EYE, among seamen, a small, obscure, sub-lime cloud, ruddy in the middle, that sometimes appears to mariners, and is the immediate forerunner of a great storm at sea.

BULL-FIGHTING, a sport or exercise much in vogue a-

mong the Spaniards and Portuguese, consisting in a kind of combat of a cavalier or torreadore against a wild bull, either on foot or on horseback, by riding at him with a lance. The Spaniards have bull-fights, i. e. feasts attended with shews, in honour of St John, the Virgin Mary, &c. This sport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think that the Moors might have received the custom from the Romans, and they from the Greeks. Dr Plot is of opinion, that the Ταυροκαταψιν ημεται among the Thessalians, who first instituted this game, and of whom Julius Cæsar learned and brought it to Rome, were the origin both of the Spanish and Portuguese bull-fighting, and of the English bull-running. This practice was prohibited by Pope Pius V. under pain of excommunication incurred *ipso facto*. But succeeding popes have granted several mitigations in behalf of the toradors.

From the following account of a bull-feast in the Coliseum at Rome 1332, extracted from Muratori by Mr Gibbon, the reader may form some idea of the pomp, the ceremonies, and the danger, which attended these exhibitions. "A general proclamation as far as Rimini and Ravenna invited the nobles to exercise their skill and courage in this perilous adventure. The Roman ladies were marshalled in three squadrons, and seated in three balconies, which on this day, the third of September, were lined with scarlet cloth. The fair Jacova di Rovere led the matrons from beyond the Tiber, a pure and native race, who still represent the features and character of antiquity. The remainder of the city was divided between the Colonna and Urfini families: the two factions were proud of the number and beauty of their female bands: the charms of Savella Urfini are mentioned with praise; and the Colonna regretted the absence of the youngest of their house, who had sprained her ankle in the garden of Nero's tower. The lots of the champions were drawn by an old and respectable citizen; and they descended into the arena, or pit, to encounter the wild-bulls, on foot as it should seem, with a single spear. Amidst the crowd, our annalist has selected the names, colours, and devices, of 20 of the most conspicuous knights. Several of the names are the most illustrious of Rome and the ecclesiastical state; Malatesta, Polenta, della Valle, Cafarello, Savelli, Capoccio, Conti, Annibaldi, Altieri, Corsi. The colours were adapted to their taste and situation. And the devices are expressive of hope or despair, and breathe the spirit of gallantry and arms. "I am alone, like the youngest of the Horatii," the confidence of an intrepid stranger: "I live disconsolate," a weeping widower: "I burn under the ashes," a discreet lover: "I adore Lavinia or Lucretia," the ambiguous declaration of a modern passion: "My faith is as pure," the motto of a white livery: "Who is stronger than myself?" of a lion's hide: "If I am drowned in blood, what a pleasant death!" the wish of ferocious courage. The pride or prudence of the Urfini restrained them from the field, which was occupied by three of their hereditary rivals, whose inscriptions denoted the lofty greatness of the Colonna name: "Though sad, I am strong:" "Strong as I am great:" "If I fall (addressing himself to the spectators) you fall with me:"—intimating (says the writer), that while the other families were the subjects of

Bull.

Bull.

the Vatican, they alone were the supporters of the Capitol. The combats of the amphitheatre were dangerous and bloody. Every champion successively encountered a wild bull; and the victory may be ascribed to the quadrupeds, since no more than eleven were left on the field, with the loss of nine wounded and 18 killed on the side of their adversaries. Some of the noblest families might mourn; but the pomp of the funerals, in the churches of St John Lateran and St Maria Maggiore, afforded a second holiday to the people.— Doubtless it was not in such conflicts that the blood of the Romans should have been shed: yet, in blaming their rashness, we are compelled to applaud their gallantry; and the noble volunteers, who display their magnificence and risk their lives under the balconies of the fair, excite a more generous sympathy than the thousands of captives and malefactors who were reluctantly dragged to the scene of slaughter.”

A striking relic of barbarity in the Spanish manners of the present day, is the excessive attachment of that nation to bull-fights, a spectacle which shocks the delicacy of every other people in Europe. Many Spaniards consider this practice as the sure means of preserving that energy by which they are characterised, and of habituating them to violent emotions, which are terrible only to timid minds. But it seems difficult to comprehend what relation there is between bravery and a spectacle where the assistants now run no danger; where the actors prove by the few accidents which befall them, that theirs has nothing in it very interesting; and where the unhappy victims meet only with certain death as the reward of their vigour and courage. Another proof that these spectacles have little or no influence on the disposition of the mind is, that children, old men, and people of all ages, stations, and characters, assist at them; and yet their being accustomed to such bloody entertainments appears neither to correct their weakness and timidity, nor alter the mildness of their manners.

The bull-fights are very expensive; but they bring great gain to the undertakers. The worst places cost two or four rials, according as they are in the sun or in the shade. The price of the highest is a dollar. When the price of the horses and bulls, and the wages of the *Torreadores*, have been paid out of this money, the rest is generally appropriated to pious foundations: at Madrid it forms one of the principal funds of the hospital. It is only during summer that these combats are exhibited, because the season then permits the spectators to sit in the open air, and because the bulls are then more vigorous. Those which are of the best breed are condemned to this kind of sacrifice; and connoisseurs are so well acquainted with their distinguishing marks, that as soon as a bull appears upon the arena, they can mention the place where he was reared. This arena is a kind of circus surrounded by about a dozen of seats, rising one above another; the highest of which only is covered. The boxes occupy the lower part of the edifice. In some cities, Valladolid for example, which have no place particularly set apart for these combats, the principal square is converted into a theatre. The balconies of the houses are widened, so as to project over the streets which end there; and it is really a very interesting sight to see the different classes of people assembled around this square, wait-

Bull.

ing for the signal when the entertainment is to commence, and exhibiting every external sign of impatience and joy. The spectacle commences by a kind of procession around the square, in which appear, both on horseback and on foot, the combatants who are to attack the fierce animal; after which two alguazils, dressed in perukes and black robes, advance with great gravity on horseback; who go and ask from the president of the entertainment an order for it to commence. A signal is immediately given; and the animal, which was before shut up in a kind of hovel with a door opening into the square, soon makes his appearance. The officers of justice, who have nothing to do with the bull, prudently hasten to retire, and their fright is a prelude to the cruel pleasure which the spectators are about to enjoy. The bull, however, is received with loud shouts, and almost stunned by the noisy expressions of their joy. He has to contend first against the picadores, combatants on horseback, who, dressed according to the ancient Spanish manner, and as it were fixed to their saddles, wait for him, each being armed with a long lance. This exercise, which requires strength, courage, and dexterity, is not considered as disgraceful. Formerly the greatest lords did not disdain to practise it; even at present some of the hidalgos solicit for the honour of fighting the bull on horseback, and they are then previously presented to the people, under the auspices of a patron, who is commonly one of the principal personages at court.

The picadores, whoever they may be, open the scene. It often happens that the bull, without being provoked, darts upon them, and every body entertains a favourable opinion of his courage. If, notwithstanding the sharp pointed weapon which defends his attack, he returns immediately to the charge, their shouts are redoubled, as their joy is converted into enthusiasm; but if the bull, struck with terror, appears pacific, and avoids his persecutors, by walking round the square in a timid manner, he is hooted at and hissed by the whole spectators, and all those near whom he passes load him with blows and reproaches. He seems then to be a common enemy, who has some great crime to expiate; or a victim, in the sacrifice of which all the people are interested. If nothing can awaken his courage, he is judged unworthy of being tormented by men; the cry of *perros, perros*, brings forth new enemies against him, and large dogs are let loose upon him, which seize him by the neck and ears in a furious manner. The animal then finds the use of those weapons with which nature has furnished him; he tosses the dogs into the air, who fall down stunned, and sometimes mangled; they however recover, renew the combat, and generally finish by overcoming their adversary, who thus perishes ignobly. If, on the other hand, he presents himself with a good grace, he runs a longer and nobler, but a much more painful career. The first act of the tragedy belongs to the combatants on horseback; this is the most animated and bloody of all the scenes, and often the most disgusting. The irritated animal braves the pointed steel which makes deep wounds in his neck, attacks with fury the innocent horse who carries his enemy, rips up his sides, and overturns him together with his rider. The latter, then dismounted and disarmed, would be exposed to imminent danger, did not combatants on foot, called

Bull.

chulos, come to divert the bull's attention, and to provoke him, by flaking before him different pieces of cloth of various colours. It is, however, at their own risk that they thus save the dismounted horseman; for the bull sometimes pursues them, and they have then need for all their agility. They often escape from him by letting fall in his way the piece of stuff which was their only arms, and against which the deceived animal expends all his fury. Sometimes he does not accept this substitute, and the combatant has no other resource but to throw himself speedily over a barrier, six feet high, which incloses the interior part of the arena. In some places this barrier is double, and the intermediate space forms a kind of circular gallery, behind which the pursued torreadore is in safety. But when the barrier is single, the bull attempts to jump over it, and often succeeds. The reader may easily imagine in what consternation the nearest of the spectators then are; their haste to get out of the way, and to crowd to the upper benches, becomes often more fatal to them than even the fury of the bull, who, stumbling at every step, on account of the narrowness of the place and the inequality of the ground, thinks rather of his own safety than of revenge, and besides soon falls under the blows which are given him from all quarters.

Except in such cases, which are very rare, he immediately returns. His adversary recovered, has had time to get up; he immediately remounts his horse, provided the latter is not killed or rendered unfit for service, and the attack commences; but he is often obliged to change his horse several times. Expressions cannot then be found to celebrate these acts of prowess, which for several days become the favourite topic of conversation. The horses, very affecting models of patience, courage, and docility, may be seen treading under their feet their own bloody entrails, which drop from their sides half torn open, and yet obeying, for some time after, the hand which conducts them to new tortures. Spectators of delicacy are then filled with disgust, which converts their pleasure into pain. A new act is however preparing, which reconciles them to the entertainment. As soon as it is concluded that the bull has been sufficiently tormented by the combatants on horseback, they retire and leave him to be irritated by those on foot. The latter, who are called *banderilleros*, go before the animal; and the moment he darts upon them they plunge into his neck, two by two, a kind of darts called *banderillas*, the points of which are hooked, and which are ornamented with small streamers made of coloured paper. The fury of the bull is now redoubled; he roars, tosses his head, and the vain efforts which he makes serve only to increase the pain of his wounds: this last scene calls forth all the agility of his adversaries. The spectators at first tremble for them, when they behold them braving to near the horns of this formidable animal; but their hands, well exercised, aim their blows so skillfully, and they avoid the danger so nimbly, that after having seen them a few times, one neither pities nor admires them, and their address and dexterity seem only to be a small episode of the tragedy, which concludes in the following manner: When the vigour of the bull appears to be almost exhausted; when his blood, issuing from twenty wounds, streams along his neck and moi-

Bull.

stens his robust sides; and when the people, tired of one object, demand another victim; the president of the entertainment gives the signal of death, which is announced by the sound of trumpets. The matador then advances, and all the rest quit the arena; with one hand he holds a long dagger, and with the other a kind of flag, which he waves backwards and forwards before his adversary. They both stop and gaze at one another; and while the agility of the matador deceives the impetuosity of the bull, the pleasure of the spectators, which was for some time suspended, is again awakened into life. Sometimes the bull remains motionless, throws up the earth with his foot, and appears as if meditating revenge.

The bull in this condition, and the matador who calculates his motions and divines his projects, form a group which an able pencil might not disdain to delineate. The assembly in silence behold this dumb scene. The matador at length gives the mortal blow; and if the animal immediately falls, a thousand voices proclaim with loud shouts the triumph of the conqueror; but if the blow is not decisive, if the bull survives and seeks still to brave the fatal steel, murmurs succeed to applause, and the matador, whose glory was about to be raised to the skies, is considered only as an unskillful butcher. He endeavours to be soon revenged, and to disarm his judges of their severity. His zeal sometimes degenerates into blind fury, and his partizans tremble for the consequences of his imprudence. He at length directs his blow better. The animal vomits up blood; he staggers and falls, while his conqueror is intoxicated with the applauses of the people. Three mules, ornamented with bells and streamers, come to terminate the tragedy. A rope is tied around the bull's horns, which have betrayed his valour, and the animal, which but a little before was furious and proud, is dragged ignominiously from the arena which he has honoured, and leaves only the traces of his blood and the remembrance of his exploits, which are soon effaced on the appearance of his successor. On each of the days set apart for these entertainments, six are thus sacrificed in the morning, and twelve in the afternoon, at least in Madrid. The three last are given exclusively to the matador, who, without the assistance of the picadores, exerts his ingenuity to vary the pleasure of the spectators. Sometimes he causes them to be combated by some intrepid stranger, who attacks them mounted on the back of another bull, and sometimes he matches them with a bear: this last method is generally destined for the pleasure of the populace. The points of the bull's horns are concealed by something wrapped round them, which breaks their force. The animal, which in this state is called *Embalsado*, has power neither to pierce nor to tear his antagonist. The amateurs then descend in great numbers to torment him, each after his own manner, and often expiate this cruel pleasure by violent contusions; but the bull-always falls at length under the stroke of the matador. The few spectators who are not infected by the general madness for this sport, regret that those wretched animals do not, at least, purchase their lives at the expence of so many torments and so many efforts of courage; they would willingly assist them to escape from their persecutors. In the minds of such spectators disgust succeeds compassion, and satiety suc-

ceeds

ceeds disgust. Such a series of uniform scenes makes that interest become languid, which this spectacle, on its commencement, seemed to promise. But to connoisseurs, who have thoroughly studied all the stratagems of the bull, the returns of his address and fury, and the different methods of irritating, tormenting, and deceiving him, none of these scenes resembles another, and they pity those frivolous observers who cannot remark all their varieties.

The Spanish government are very sensible of the moral and political inconveniences arising from this species of phrensy. They have long since perceived, that among a people whom they wish to encourage to labour, it is the cause of much disorder and dissipation; and that it hurts agriculture, by destroying a great number of robust animals, which might be usefully employed: but they are obliged to manage with caution a taste which it might be dangerous to attempt to abolish precipitately. They are, however, far from encouraging it. The court itself formerly reckoned bull-fights among the number of its festivals, which were given at certain periods. The *Plaza-Mayer* was the theatre of them, and the king and the royal family honoured them with their presence. His guards presided there in good order. His halberdiers formed the interior circle of the scene; and their long weapons, held out in a defensive posture, were the only barrier which they opposed against the dangerous caprices of the bull. These entertainments, which, by way of excellence, were called *Fights Reales*, are become very rare. Charles III. who endeavoured to polish the nation, and to direct their attention to useful objects, was very desirous of destroying a taste in which he saw nothing but inconveniences; but he was too wise to employ violent means for that purpose. He, however, confined the number of bull-fights to those, the profits of which were applied to the support of some charitable institution, with an intimation of substituting for these other funds afterwards. Bull-fights, by these means being rendered less frequent, will, perhaps, gradually lose their attractions, until more favourable circumstances permit the entire abolition of them.

Bull-Running, denotes a feudal custom obtaining in the honour of Tutbury in Staffordshire; where, anciently, on the day of the assumption of our Lady, a bull is turned loose by the lord to the minstrels; who, if they can catch him before he passes the river Dove, are to have him for their own, or, in lieu thereof, to receive each 40 pence; in consideration of which custom they pay 20 pence yearly to the said lord.

Bull and Boar. By the custom of some places, the parson is obliged to keep a bull and boar for the use of his parishioners, in consideration of his having tithes of calves and pigs, &c.

Bull-Frog, in zoology. See RANA.

Bull-Head, or *Wilder's Thumb*, in ichthyology. See COXAUS.

BULL, among ecclesiasticks, a written letter, dispatched, by order of the Pope, from the Roman chancery, and sealed with lead, being written on parchment, by which it is partly distinguished from a brief: see the article BRIEF.—It is a kind of apostolical rescript, or edict; and is chiefly in use in matters of justice or grace. If the former be the intention of the

bull, the lead is hung by a hempen chord; if the latter, by a silken thread. It is thus pendent lead, or seal, which is, properly speaking, the bull, and which is impressed on one side with the heads of St Peter and St Paul, and on the other with the name of the Pope and the year of his pontificate. The bull is written in an old, round, Gothic letter, and is divided into five parts, the narrative of the fact, the conceit, the clause, the date, and the subscription, in which the Pope styles himself *Petrus servus servorum*, i. e. the servant of servants. These instruments, besides the lead belonging to them, have a cross, with some text of Scripture, or religious motto, about it. Bulls are granted for the consecration of bishops, the promotion to benefices, and the celebration of jubilees, &c.

Bull in crua Domini, a particular bull read every year, on the day of the Lord's supper, or Maundy Thursday, in the Pope's presence, containing excommunications and anathemas against heretics, and all who disturb or oppose the jurisdiction of the holy see. After the reading of the bull, the Pope throws a burning torch in the public place, to denote the thunder of this anathema.

Golden Bull, an edict, or imperial constitution, made by the emperor Charles IV. reputed to be the magna charta, or the fundamental law of the German empire.

It is called *golden*, because it has a golden seal, in the form of a pope's bull, tied with yellow and red cords of silk: upon one side is the emperor represented sitting on his throne, and on the other the capital of Rome. It is also called *Caroline*, on Charles IV's account. Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious and undetermined, and the number of the electors not fixed. This solemn edict regulated the functions, rights, privileges, and pre-eminences, of the electors. The original, which is in Latin, on vellum, is preserved at Francfort: this ordinance, containing 30 articles or chapters, was approved of by all the princes of the empire, and remain still in force.

Silver Bulls were not in so frequent use; tho' we do not want instances of them.

Leadn Bulls were sent by the emperors of Constantinople to despots, patriarchs, and princes; and the like were also used by the grandees of the Imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes. It is to be observed, that the leaden bulls of these had, on one side, the name of the pope or bishop inscribed. Polydore Virgil makes pope Stephen VII. the first who used leaden bulls, about the year 772. But others find instances of them as early as Silvester, I. e. I. and Gregory the Great. The latter popes, beside their own names, strike the figures of St Peter and St Paul on their bulls; a practice first introduced by Pius Pafchal II. But w^ho, in these bulls, the figure of St Paul is on the right, and that of St Peter on the left side, is a question which has occasioned many conjectures and disputes.

Waxen Bulls are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus styled letters to their wives, mothers, and sons. Of these there were two sorts, one red, and the other green.

Bulla,
Bullæ.

BULLA, or DIFFER, in zoology, a genus belonging to the order of vermes testaceæ. It is an animal of the snail-kind: the shell consists of one valve, convoluted, and without any prickles; the aperture is narrowish, oblong, longitudinal, and entire at the base; the colomella is smooth and oblique. There are 23 species; four of them found in the British seas; the rest chiefly natives of the Asiatic and Atlantic oceans.

BULLÆ, in antiquity, a kind of ornaments much in use among the ancient Romans. Mr Whittaker * is of opinion that they were originally formed of leather among all ranks of people; and it is certain that they continued so to the last among the commonalty. He also imagines, that at first the bulla was intended as an amulet rather than an ornament; as a proof of which he tells us that the bullæ were frequently impressed with the figure of the sexual parts. It is universally asserted by the critics, that the bullæ were made hollow for the reception of an amulet; but this Mr Whittaker contradicts from the figure of a golden one lately found at Manchester, which had no aperture whereby an amulet could have been introduced.—Pliny refers the original of the bulla to the elder Tarquin, who gave one with the prætexta to his son, because at the age of 4 he had with his own hand killed an enemy; and in imitation of him it was afterwards assumed by other patricians. Others affirm that the bulla was given by that king to the sons of all the patricians who had borne civil offices. Lastly, others allege that Romulus first introduced the bulla, and gave it to Tullus Hostilius, the first child born of the rape of the Sabines.—As to the form of the bullæ, Mr Whittaker informs us that they were originally made in the shape of hearts; but they did not always retain the form of an heart, any more than they were always made of leather. As the wealth of the state and the riches of individuals increased, the young patrician distinguished himself by a bulla of gold, while the common people wore the amulet of their ancestors. The figure of an heart then became so generally round, some even having the impression of an heart upon them, that there are not many of the original form to be found in the cabinets of the curious. The form is naturally varied from a complete circle to that of a segment; and this was the shape of the abovementioned bulla found at Manchester. When the youth arrived at 15 years of age, they hung up their bullæ about the necks of their gods lares. We are further informed, that the bullæ were not only hung about the necks of young men, but of horses also. We may add, that bullæ were sometimes allowed to statues; whence the phrase *statua bullatæ*.

BULLÆ was also the denomination given to divers other metalline ornaments made after the same form; and in this sense *bullæ* seem to include all gold and silver ornaments of a roundish form, whether worn on the habits of men, the trappings of horses, or the like. Such were those decorations used by the ancients on their doors and belts. The bullæ of doors were a kind of large-headed nails fastened on the doors of the rich, and kept bright with great care. The doors of temples were sometimes adorned with golden bullæ. Mr Banelot takes the bullæ worn by soldiers on their belts to be something more than mere ornaments. They seem to have been considered as preservations from dangers

and diseases, and even means of acquiring glory, and other advantages. The like may perhaps be extended to the bullæ on doors, which were probably placed there as a security to them from being broken or violated.

BULLÆ also denoted a table hung up in the public courts, to distinguish which days were fasti, and which nefasti; answering in some measure to our kalendar.

BULLETT, an iron or leaden ball or shot, wherewith fire arms are loaded. Bullets are cast in iron moulds, consisting of two concave hemispheres, with a handle whereby to hold them; and between them is a hole, called *the gate*, at which to pour in the melted metal. The chaps or hemispheres of bullet-moulds are first punched, being blood-red hot, with a round ended punch, of the shape and nearly of the size of the intended bullets. To cleanse the insides, they make use of a bullet bore, which consists of a steel shank, having a globe at one end, wherewith to bore the inside of a mould clean, and of the intended size.

BULLEYN (William), a learned physician and botanist, was born in the isle of Ely, in the former part of the reign of Henry VIII. and educated at Cambridge. Botany being his favourite study, he travelled through various parts of England, Scotland, and Germany, chiefly with an intention to improve his knowledge in that science. In the reign of Edward VI. or of queen Mary, Mr Bulleyn appears, from his remarks on the natural productions of that country, to have resided at Norwich, or in that neighbourhood, and also to have spent some time at Bloxhall in Suffolk: but he afterwards removed into the north, and settled at Durham, where he practised physic with considerable reputation and success. His great patron at this time was Sir Thomas Hilton, knight, baron of Hilton, who was governor of Tinmouth castle in the reign of Philip and Mary. In 1560, he came to London; and soon after his arrival, was accused by William Hilton of Bidick, of having murdered his brother Sir Thomas, our author's friend and patron. He was arraigned before the duke of Norfolk, and honourably acquitted. This Hilton afterwards hired some villains to assassinate the doctor; but this attempt proving ineffectual, he had him arrested on an action for debt, and he remained for a long time in prison. During this confinement, Dr Bulleyn composed several of those works which raised his reputation as a medical writer. He died in January 1576, and was buried in St Giles's Cripplegate, in the same grave with his brother the divine, who died 13 years before, and in which John Fox the martyrologist was interred 11 years after. Dr Bulleyn appears from his writings to have been well acquainted with the works of the ancient Greek, Roman, and Arabian physicians. According to the modern practice, his books, were they generally known, would be of little use; but as he was a man of genius and fertile imagination, they are by no means barren of entertainment. He wrote, 1. The government of health, 1559, 8vo. 2. A regimen against the pleurisy, 8vo. London, 1562. 3. Bulleyn's bulwark of defence against all sickness, forenes, and wounds that dooe daily assault mankind, London printed by John Kingston, 1562, folio. This includes, The government of health. 4. A dialogue both pleasant and pietifull, wherein is a goodlie regimen against the fever pestilence,

Bullet,
Bulleyn.

Bullaldus lence, with a consolation and comfort against death, London, 1564, 8vo. 1569, 8vo. Very scarce. There is a wooden print of the author prefixed to the first edition of his government of health; also a small one engraved by Stukeley in 1722.

BULLIALDUS (Ismael), an eminent astronomer, was born at Laon in the isle of France in 1605. He travelled in his youth for the sake of improvement; and afterwards published several works, among which are, 1. *De natura lucis*. 2. *Philolaus*. 3. *Astronomia philolaica, opus novum, in quo motus planetarum per novam et veram hypothesein demonstrantur*. 4. *Astronomia philolaica fundamenta clarius explicata et asserta adversus Zothi Wardi impugnationem*. He also wrote a piece or two upon Geometry and Arithmetic. In 1661, he paid Hevelius a visit at Dantzic, for the sake of seeing his optical and astronomical apparatus. Afterwards he became a preacher at Paris, and died there in 1694.

BULLINGER (Henry), born at Bremgarten in Switzerland in 1504, was an eminent Zuinglian minister, a great supporter of the reformation, and employed in many ecclesiastical negotiations. He composed many books, one against Luther in particular. He died in 1575.

BULLION, uncoined gold or silver in the mass.

Those metals are called so, either when smelted from the native ore, and not perfectly refined; or when they are perfectly refined, but melted down in bars or ingots, or in any unwrought body, of any degree of fineness.

When gold and silver are in their purity, they are so soft and flexible, that they cannot well be brought into any fashion for use, without being first reduced and hardened with an alloy of some other baser metal.

To prevent these abuses which some might be tempted to commit in the making of such alloys, the legislators of civilized countries have ordained, that there shall be no more than a certain proportion of a baser metal to a particular quantity of pure gold or silver, in order to make them of the fineness of what is called the standard gold or silver of such a country.

According to the laws of England, all sorts of wrought plate in general ought to be made to the legal standard; and the price of our standard gold and silver is the common rule whereby to set a value on their bullion, whether the same be ingots, bars, dust, or foreign specie: whence it is easy to conceive that the value of bullion cannot be exactly known, without being first essayed, that the exact quantity of pure metal therein contained may be determined, and consequently whether it be above or below the standard.

Silver and gold, whether coined or uncoined (though used for a common measure of other things), are no less a commodity than wine, tobacco, or cloth; and may, in many cases, be exported as much to the national advantage as any other commodity.

BULLOCK, the same with an ox, or gelded bull. See **BOS**.

BULTER, a term used to denote the refuse of meal after dressing, or the cloth wherein it is dressed, otherwise called *butter-cloth*.

BULWARK, in the ancient fortification. See **RAMPART**.

BUMICHLI, a religious sect of Mahometans in Egypt and Barbary, who pretend to fight with devils,

and commonly appear in a fright and covered with wounds and bruises. About the full moon they counterfeit a combat in the presence of all the people, which lasts for two or three hours, and is performed with assagaias, or javelins, till they fall down quite spent; in a little time, however, they recover their spirits, get up, and walk away.

BUNDLE, a collection of things wrapped up together. Of balle-ropes, harness-plates, and glovers knives, ten make a bundle; of Hamburgh yarn, twenty skeans; of basket rods, three sect the band.

BUNEL (Peter), a native of Toulouse, was one of the most elegant writers of the Latin tongue in the 16th century, but was still more conspicuous for the regularity of his manners. He did not seek either for riches or lucrative employments; but, contented with the bare necessities of life, applied himself wholly to the improvement of his mind. He died at Turin in 1547, aged 47; and has left behind him some Latin epistles, which are written with the utmost purity. The magistrates of Toulouse have a bust of him in marble, placed in their town-house. The most correct edition of his Letters is that of Henry Stephens in 1581.

BUNGAY, a market-town of Suffolk, situated on the river Wavenny, about 32 miles north-east of Eury. E. Long. 1. 35. N. Lat. 52. 35.

BUNIAS, in botany; a genus of the 39th natural order, *Siliqueae*, belonging to the tetradynamia class of plants, for which there is no English name. The silicula is deciduous, four-sided, mucicated, or shagreened with unequal pointed angles. There are eight species; all of them annual plants, but none of them possessed of any remarkable property.

BUNIAM, *fig-nut*, or *carth-nut*, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellulæ*. The corolla is uniform, the umbel thick, and the fruit ovate. There is but one species, the *bulbocallanum*, with a globular root. This grows naturally in moist pastures in many parts of Britain. It hath a tuberous solid root, which lies deep in the ground. The leaves are finely cut, and lie near the ground. The stalk rises a foot and an half high; is round, channelled, and solid; the lower part being naked; but above, where it branches out, there is one leaf placed below every branch. The flowers are white, and shaped like those of other umbelliferous plants; the seeds are small, oblong, and when ripe are channelled. The roots of this sort are frequently dug up, and by some people eaten raw. They have much resemblance in taste to a chestnut, whence the plant obtains the name of *bulbocallanum*.

BUNT of a *SAIL*, the middle part of it, formed diagonally into a bag or cavity, that the sail may gather more wind. It is used mostly in top-sails, because courses are generally cut square, or with but small allowance for bunt or compass. The bunt holds much leeward wind; that is, it hangs much to leeward.

Bunt-lines are small lines made fast to the bottom of the sails, in the middle part of the bolt-rope, to a cringle, and to are reeved through a small block, seized to the yard. Their use is to trice up the bunt of the sail for the better furling it up.

BUNTING, in ornithology. See **EMBERIZA**.

BUNT

Bundie

Bunting

Bunting-

Buoy.

BUNTINGFORD, a town of Hertfordshire, with a market on Mondays, and two fairs, on June 29th. and November 30th, for pedlars ware. It is a good thoroughfare town, but small, and is accounted only a large hamlet. W. Long. o. 6. N. Lat. 51. 55.

BUNTZEL, or **BUNTZLAU**, a town of Silesia, in the duchy of Janes. The greatest part of the houses are built with stone, and there were formerly rich mines in the neighbourhood. It is in the common road to Leipzig; and their trade is earthen ware, of which they make great quantities. E. Long. 15. 50. N. Lat. 51. 12.

BUNYAN (John), author of the *Pilgrim's Progress*, was born at Elitow, near Bedford, in 1628. He was the son of a tinker; and, in the early part of his life, was a great reprobate, and a soldier in the parliament army: but being at length deeply struck with a sense of his guilt, he laid aside his profligate courses, became remarkable for his sobriety, and applied himself to obtain some degree of learning. About the year 1655, he was admitted a member of a Baptist congregation at Bedford, and was soon after chosen their preacher: but, in 1660, being taken up, and tried for presuming to preach, he was cruelly sentenced to perpetual banishment; and in the mean time committed to jail, where necessity obliged him to learn to make long-tugged thread-laces for his support: to add to his distresses, he had a wife and several children, among whom was a daughter who was blind. In this unjust and cruel confinement he was detained twelve years and a half, and during that time wrote many of his tracts; but he was at length discharged, by the humane interposition of Dr Barlow. When king James's declaration for liberty of conscience was published, he was chosen pastor of a congregation at Bedford. He at length died of the fever at London, on the 31st of August 1688, aged 60. He also wrote an allegory, called *The Holy War*. His *Pilgrim's Progress* has been translated into most European languages; and his works have been collected together, and printed in two volumes folio.

BUONOCARSI, or **PIERINO DEL VAGA**. See **PIERINO**.

BUOY, in sea affairs, a sort of close cask, or block of wood, fastened by a rope to the anchor, to determine the place where the anchor is situated, that the ship may not come too near it, to entangle her cable about the flock or the flukes of it.

Buoys are of various kinds; as,

Can-Buoys: these are in the form of a cone; and of this construction are all the buoys which are floated over dangerous banks and shallows, as a warning to passing ships, that they may avoid them. They are extremely large, that they may be seen at a distance; and are fastened by strong chains to the anchors which are sunk for this purpose at such places. See **Plate CVIII. fig. 6.**

Nun-Buoys are shaped like the middle frustum of two cones, abutting upon one common base, being casks, which are large in the middle, and tapering nearly to a point at each end. **Plate CVIII. fig. 7.**

Woolen Buoys are solid pieces of timber, sometimes in the shape of a cylinder, and sometimes in that of a nun-buoy; they are furnished with one or two holes, in which to fix a short piece of rope, whose two ends, being spliced together, make a sort of circle or ring called the *strop*.

N^o 60.

Cable-Buoys, are common casks employed to buoy up the cables in different places from rocky ground. In the harbour of Alexandria in Egypt, every ship is moored with at least three cables, and has three or four of these buoys on each cable for this purpose.

Slings of the Buoy, the ropes which are fastened about it, and by which it is hung: they are curiously spliced round it, something resembling the braces of a drum.

To stream the Buoy, is to let it fall from the ship's side into the water; which is always done before they let go the anchor, that it may not be retarded by the buoy-rope as it sinks to the bottom.

Buoy-Rope, the rope which fastens the buoy to the anchor: it should be little more than equal in length to the depth of the water where the anchor lies, as it is intended to float near, or immediately above, the bed of it, that the pilot may at all times know the situation thereof. See **Plate XXIX. fig. 1. n^o 3.** where *b* is the anchor, *c* the buoy-rope, and *d* the buoy floating on the surface of the water. The buoy-rope is often extremely useful otherwise, in drawing up the anchor when the cable is broke. It should always, therefore, be of sufficient strength for this purpose, or else the anchor may be lost through negligence.

Buoy of the Nose, is a buoy placed at the mouth of the river Thames, to direct mariners how to avoid a dangerous sand.

BUOYANT, something which, by its aptness to float, bears up other more ponderous and weighty things. See **BUOY**.

BUPALUS, a celebrated sculptor, and native of the island of Chios, was son, grandson, and great-grandson of sculptors. He had a brother, named *Athenis*, of the same profession. They flourished in the 60th Olympiad; and were cotemporary with Hipponax, a poet of an ugly and despicable figure. Our sculptors diverted themselves in representing him under a ridiculous form. But Hipponax wrote so sharp a satire against them, that they hanged themselves, as some say. Pliny, however, does not allow this; but says, on the contrary, that, after Hipponax had taken his revenge, they made several fine statues in several places; particularly a Diana at Chios, which was placed very high, and appeared with a frowning countenance to those that came in, and with a pleasant one to those that went out. There were several statues at Rome made by them; and they worked only in the white marble of the isle of Paros. Pausanias mentions Bupalus as a good architect as well as sculptor; but says nothing of Athenis.

BUPHAGA, in ornithology, a genus belonging to the order of picæ. The beak is straight and quadrangular; the mandibles are gibbous, entire, and the gibbosity is greater on the outside. The feet are of the ambulatory kind. The body is greyish above, and of a dirty yellow below; the tail is shaped like a wedge. There is but one species, viz. the *africana*, a native of Senegal. It frequently perches upon oxen, and picks out the worms from their backs.

BUPHONIA (from *βους* ox, and *πυρ* slaughter), in antiquity, an Athenian feast or ceremony, denominated from a bullock slain therein, with quaint formalities. For the origin of the buphonia, we are told it was forbidden by the laws of Attica to kill an ox: but it once happened, at the feast of the *diipolia*, that an ox

Buoyant

suprestis.

eat the corn, others say the cakes, which had been dressed for the sacrifice. Thaulon the priest, enraged at this, presently killed him, and fled for it. On which the Athenians, fearing the resentment of the gods, and feigning themselves ignorant who had committed the fact, brought the bloody axe before the judges, where it was solemnly arraigned, tried, found guilty, and condemned. And, in memory of this event, a feast was instituted under the denomination of *buphonia*. In which it was still customary for the priest to fly, and judgment to be given about the slaughter of the ox.

BUPHTHALMUM, OX-EYE: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is palaceous; the pappus an indifferent rim; the seeds, especially those of the radius, emarginated on the sides; the stigmata of the hermaphrodite florets undivided. There are ten species; of which the following are the most remarkable.

Species. 1. The *helianthoides*, a native of North America. This hath a perennial root, and an annual stalk, which rises six or eight feet high, garnished at each joint with two oblong heart-shaped leaves, which have three longitudinal veins, and the base on one side shorter than the other. The flowers come out at the extremities of the branches, and are of a bright yellow colour, resembling a small sun-flower. 2. The *arborescens*, rises with several woody stems to the height of eight or ten feet, garnished with leaves very unequal in size; some are narrow and long, others are broad and obtuse; these are intermixed at the same joint, and often at the intermediate one; they are green, and placed opposite. The flowers are produced at the ends of the branches; they are of a pale yellow colour, and have scaly empalements.

Culture. All the species may be propagated by seeds; and those which do not, by parting their roots, or cutting of their branches. Some of the species are tender, and require to be raised on a hot-bed.

BUPLEURUM, HARE'S-EAR, or *Thorough-awax*: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The involucre of the partial umbels are large in proportion, and pentaphyllous; the petals involuted or rolled inwards; the fruit roundish, compressed, and striated. The principal species is the fruticosum or shrubby Ethiopian hartwort. This rises with a shrubby stem, dividing into numerous branches, forming a bushy head five or six feet high, adorned with oblong, oval, entire leaves of a pale green colour, placed alternate, with yellow flowers in umbels at the ends of the branches, which appear in July and August, and are sometimes succeeded by ripe seeds. It may be propagated by cuttings.

BUPRESTIS, in zoology, a genus of insects belonging to the order of coleoptera. The antennæ are fetaceous, and as long as the thorax: The head is half drawn back within the thorax; to which may be added, that the antennæ are serrated: The mouth is armed with jaws, and furnished with palpi: The clytra are margined, and cover the abdomen; and the tarsi have five articulations: The feet are saltatorii. There are 27 species of this insect, most of them natives of

the Indies. The French have given the name of *Richard* to this genus, on account of the beautiful rich colours with which most of the insects belonging to it are adorned. Insects of this genus are not common in England. They are of the richest splendor; and some appear, when alive, to be united in colour with the resplendent particles of emeralds, rubies, diamonds, and gold. Applied to the microscope, the splendor is so great as to dazzle the eye. The guttata is one of the most oblong species. The whole body is green and gold, with a bluish cast underneath; but what distinguishes it, are four white dents or depressed spots that are seen upon the elytra, two upon each. One of those dots is on the outward rim of the clytrum, about the middle of it, near the abdomen, and is the larger one. The other is on the inner edge, close to the suture, about three-fourths of that suture downwards, and exactly opposite its fellow on the other clytrum. This latter one is the smaller. The whole upper part of the insect, viewed through a glass, appears finely dotted. This species has been found in timber-yards.

BUQUOI, a town of Artois, in the French Netherlands, situated on the confines of Picardy. E. Long. 2. 40. N. Lat. 50. 12.

BUR, a broad ring of iron, behind the place made for the hand on the spears used formerly in tilting; which bur was brought to rest, when the tilter charged his spear.

BURBAS, in commerce, a small coin at Algiers, with the arms of the dey struck on both sides: it is worth half an asper.

BURCHAUSEN, a town of Germany, in the Lower Bavaria, situated on the river Saltz. E. Long. 13. 25. N. Lat. 48. 5.

BURDEGALA, or BURNIGALA, (anc. geog.; a trading port town of Aquitania, situated on a lake of the sea, formed by the mouth of the Garunna. It was a famous seat of the Muses, as appears by Avsonius's book entitled *Professus*; and birth-place of Anfonius: Now Bourdeaux, capital of the Bourdelois, on the river Garonne. W. Long. 40, Lat. 44. 54.

BURDEN, or BURDON, in music, the drone or bass, and the pipe or string which plays it: hence that part of a song, that is repeated at the end of every stanza, is called the *burden* of it.—A chord which is to be divided, to perform the intervals of music, when open and undivided, is also called the *burden*.

BURDEN properly signifies a heavy weight or load. Ringelberg recommends the bearing burdens as the best sort of exercise; especially to strengthen men of study. To this end, he had a gown lined with plates of lead, which he could just lift with both his hands. This load he bore six or seven days together, either increasing or diminishing it as he found occasion; by which means he could both write and exercise at the same time.

BURDEN also denotes a fixed quantity of certain commodities. A burden of gad-steed is two score, or 120 pounds.

BURDEN of a Ship is its contents, or number of tons it will carry. The burden of a ship may be determined thus: Multiply the length of the keel, taken within board, by the breadth of the ship, within board, taken from the midship-beam, from plank to plank; and

Eugene
H
Barl n.

Burdock || multiply the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper deck plank; and divide the last product by 94: the quotient is the content of the tonnage required. See **FREIGHT**.

BURDOCK, in botany. See **ARCTIUM** and **XANTHIUM**.

BURELL, or **CIVITA BURELLA**, a town of Italy in the kingdom of Naples, and in Abruzzo Citra, near the river Sangro. E. Long. 45. 5. N. Lat. 41. 56.

BUREN, a town of the United Provinces, in Guelderland. It gives the title of count de Buren to the prince of Orange. E. Long. 5. 22. N. Lat. 52. 0.

BUREN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn. It is seated on the river Alme, five miles south of Paderborn. E. Long. 8. 25. N. Lat. 51. 35.

BURFORD, a town of Oxfordshire, seated on an ascent on the river Windrush, is a handsome place, chiefly noted for the making of saddles. The Downs near it, noted for horse-races, are of great advantage to the town. Burford is an earldom in the family of St Albans. It is 23 miles west-north-west of Banbury, and 85 west of London. W. Long. 1. 43. N. Lat. 51. 40.

BURG, **BURGH**, or **DUN**, in northern topography. See **DUN**.

BURG, a town of Lincolnshire, seated in a marsh, 12 miles south-east of Boston, and 127 north of London. E. Long. 0. 5. N. Lat. 53. 12.

BURG, a town of the Dutch Netherlands, in Zutphen, seated on the old Iffel, 18 miles east of Nimeguen. E. Long. 6. 12. N. Lat. 52. 0.

BURG-Castle, or **Borough-Castle**, a fortress on the edge of the county of Suffolk, three miles west of Yarmouth, where the rivers Yare and Waveny meet. It was formerly a delightful place; but now only the ruins of its walls remain, near which Roman coins are often dug up.

BURGAGE, or *Tenure in BURGAGE*, is where the king, or other person, is lord of an ancient borough, in which the tenements are held by a rent certain. It is indeed only a kind of town socage; as common socage †, by which other lands are holden, is usually of a rural nature. A borough is distinguished from other towns by the right of sending members to parliament; and where the right of election is by burgage-tenure, that alone is a proof of the antiquity of the borough. Tenure in burgage, therefore, or burgage-tenure, is where houses or lands which were formerly the site of houses in an ancient borough, are held of some lord in common socage, by a certain established rent. And these seem to have withstood the shock of the Norman encroachments principally on account of their insignificance, which made it not worth while to compel them to an alteration of tenure, as 100 of them put together would scarce have amounted to a knight's fee. Besides, the owners of them, being chiefly artificers, and persons engaged in trade, could not with any tolerable propriety be put on such a military establishment as the tenure in chivalry was. The free socage, therefore, in which these tenements are held, seems to be plainly a remnant of Saxon liberty; which may also account for the great variety of customs affecting many of these tenements so held in ancient burgage; the

principal and most remarkable of which is that called *Borough-English*. See the article *Borough-English*.

BURGAU, in natural history, the name of a large species of sea-snail, of the lunar or round-mouthed kind. It is very beautifully lined with a coat, of the nature of the mother of pearl; and the artificers take this out, to use under the name of mother of pearl, though some call it after the name of the shell they take it from, *burgaudine*.

BURGAUDINE, the name given by the French artificers to what we call mother of pearl. In their works, they do not use the common nacre-shell for this, but the lining of the American burgau. Hence some call the mother of pearl *burgaudine*, and others the *burgaudine* mother of pearl.

BURGDORF, a handsome and pretty large town of Switzerland, in the canton of Bern, seated on an eminence. The river Emma is about a pistol-shot from the town; and as it often changes its bed, it frequently does a great deal of mischief. It runs at the foot of a rock of a prodigious height, and there is a stone-bridge over it. Near the town there is a sulphureous spring which supplies their baths with water, which is good against palsies and diseases of the nerves. E. Long. 7. 35. N. Lat. 47. 6.

BURGEON, in gardening, a knot or button put forth by the branch of a tree in the spring. The word is formed from the French *bourgeon*, which signifies the same, formed from the Latin *burris*, of *burra*. Bourgeon amounts to the same with what is otherwise called eye, bud, or germ. Frosts are chiefly dangerous when the burgeons begin to appear. The burgeons have the same skin, same pith, same ligneous body, and the same insertions as the stalk; that is, all the parts are the same in both, only more contracted in the former.

BURGESS, an inhabitant of a borough, or walled town, or one who possesses a tenement therein. The word is also applied to the magistrates of some towns; as the bailiff and burgesses of Leominster.

Anciently, burgesses were held in great contempt; being reputed servile, base, and unfit for war; so that the gentry were not allowed to intermarry in their families, or fight with them; but, in lieu thereof, were to appoint champions. A burgess's son was reputed of age, when he could distinctly count money, measure cloth, &c.

BURGESS is now ordinarily used for the representative of a borough-town in parliament. Burgesses are supposed to represent the mercantile part or trading interest of the nation. They were formerly allowed, by a rate established in the reign of Edward III. two shillings a day as wages. It is much to be regretted, that the members for boroughs bear above a quadruple proportion to those for counties. The right of election of burgesses depends on several local charters and customs: though, by 2 Geo. II. c. 24. the right for the future shall be allowed according to the last determination of the house of commons concerning it: and by 3 Geo. III. c. 15. no freeman, except such as claim by birth, servitude, or marriage, shall be intitled to vote, unless he hath been admitted to his freedom twelve months before. No person is eligible as a burgess, who hath not a clear estate of L. 300 a-year.

BURGGRAVE, properly denotes the hereditary governor

† See Sec-
226.

Burgh
||
Burglary.

governor of a castle, or fortified town, chiefly in Germany. The word is compounded of *burg*, town, and *graf*, or *grave count*. The burgraves were originally the same with what we otherwise call *castellans*, or *comites castellani*; but their dignity was considerably advanced under Rudolph of Hapsburgh; before his time they were ranked only as counts, and below the princes, but under him began to be esteemed on a footing with princes. In some parts, the dignity is much degenerated, especially in the palatinate. There were formerly, according to Leti, fifteen families who enjoyed the title of burgraves, thirteen of which are now extinct. But this is differently represented by others. In Bohemia the title of burgrave is given to the chief officer, or to him that commands in quality of viceroy. In Prussia, the burgrave is one of the four chief officers of the province. In Guelderland, the burgrave of Nimeguen is president of the states of the province.

BURGH. See BOROUGH.

BURGH, OR DUN. See DUN.

BURGH-BOTE signifies a contribution towards the building or repairing of castles, or walls, for the defence of a borough or city.

By the law of king Athelstan, the castles and walls of towns were to be repaired, and burgh-bote levied every year within a fortnight after rogation days. No person whatever was exempt from this service; the king himself could not exempt a man from burgh-bote: yet, in after times, exemptions appear to have been frequently granted; inasmuch, that, according to Cowel, the word *burgh-bote* came to be chiefly used to denote not the service but the liberty or exemption from it.

BURGH-BRECHE, or *brech*, a fine imposed on the community of a town, or burgh, for the breach of peace among them.

BURGH MAILS, were yearly payments to the crown of Scotland, introduced by Malcolm III. and resembling the *fee-farm* rents of burghs in England. See MAIL.

BURGH-MASTER, an officer in the tin-mines, who directs and lays out the meers for the workmen, &c. otherwise denominated bailiff and bar-master.

BURGHMASTERS. See BURGMASER.

BURGHMOTE, the court of a borough. By the laws of king Edgar, the burghmote was to be held thrice in the year; by those of Henry I. 12 times.

BURGLARY, or NOCTURNAL HOUSE-BREAKING, (*burgi latrocinium*;) which by the ancient English law was called *hamesucken*, a word also used in the law of Scotland, but in a somewhat different sense, has always been looked upon as a very heinous offence: not only because of the abundant terror it carries with it, but also as it is a forcible invasion and disturbance of that right of habitation which every individual might acquire even in a state of nature; an invasion which, in such a state, would be sure to be punished with death, unless the assailant were stronger. But, in civil society, the laws come in to the assistance of the weaker party: and, besides that they leave him this natural right of killing the aggressor if he can, they also protect and avenge him in case the assailant is too powerful. And the law has so particular and tender a regard to the immunity of a man's house, that it styles it his *castle*, and will never suffer it to be violated with impunity; agreeing herein with the sentiments of ancient Rome. For this reason no outward doors can in gene-

ral be broken open to execute any civil process; though in criminal causes the public safety supercedes the private. Hence also in part arises the animadversion of the law upon eaves-droppers, nuisanceers, and incendiaries: and to this principle it must be added, that a man may assemble people together lawfully (at least if they do not exceed 11), without danger of raising a riot, rout, or unlawful assembly, in order to protect his house; which he is not permitted to do in any other case.

The definition of a burglar, as given us by Sir Edward Coke, is, "he that by night breaketh and entereth into a mansion house, with intent to commit a felony." In this definition there are four things to be considered; the *time*, the *place*, the *manner*, and the *intent*.

1. The *time* must be by night, and not by day; for in the day-time there is no burglary; *i. e.* if there be day-light or crepusculum enough, begun or left, to discern a man's face withal. But this does not extend to moonlight; for then many midnight burglaries would go unpunished: and besides, the malignity of the offence does not consist so much in its being done in the dark, as at the dead of night; when all the creation, except beasts of prey, are at rest; when sleep has disarmed the owner, and rendered his castle defenceless.

2. As to the *place*. It must be, according to Sir Edward Coke's definition, in a mansion-house: for no distant barn, warehouse, or the like, are under the same privileges, nor looked upon as a man's castle of defence; nor is a breaking open of houses wherein no man resides, and which for the time being are not mansion-houses, attended with the same circumstances of midnight terror. A house, however, wherein a man sometimes resides, and which the owner hath left only for a short season, *animo revertendi*, is the object of burglary, though no one be in it at the time of the fact committed. And if the barn, stable, or warehouse, be parcel of the mansion-house, though not under the same roof or contiguous, a burglary may be committed therein; for the capital house protects and privileges all its branches and appurtenants, if within the curtilage or homestall. A chamber in a college, or an inn of court, where each inhabitant hath a distinct property, is, to all other purposes as well as this, the mansion-house of the owner. So also is a room or lodging in any private house, the mansion for the time being of the lodger; if the owner doth not himself dwell in the house, or if he and the lodger enter by different outward doors. But if the owner himself lies in the house, and hath but one outward door at which he and his lodgers enter, such lodgers seem only to be inmates, and all their apartments to be parcel of the one dwelling-house of the owner.

3. As to the *manner* of committing burglary: there must be both a breaking and an entry to complete it. But they need not be both done at once; for if a hole be broken one night, and the same breakers enter the next night through the same, they are burglars. There must be an actual breaking; as, at least, by breaking or taking out the glass of, or otherwise opening, a window; picking a lock, or opening it with a key; nay, by lifting up the latch of a door, or unloosing any other fastening which the owner has provided. But if a person leaves his doors or windows open, it is his own folly

Burglary
||
Furg'o.

Burgos
||
Burial.

and negligence; and if a man enters therein, it is no burglary; yet, if he afterwards unlocks an inner or chamber door, it is so. But to come down a chimney is held a burglarious entry; for that is as much closed as the nature of things will permit. So also, to knock at a door, and, upon opening it, to rush in with a felonious intent; or, under pretence of taking lodgings, to fall upon the landlord and rob him; or to procure a constable to gain admittance in order to search for traitors, and then to bind the constable and rob the house; all these entries have been adjudged burglarious, though there was no actual breaking: for the law will not suffer itself to be trifled with by such evasions, especially under the cloak of legal process. As for the *entry*, any the least degree of it, with any part of the body, or with an instrument held in the hand, is sufficient: as, to step over the threshold, to put a hand or hook in at a window to draw out goods, or a pistol to demand one's money, are all of them burglarious entries. The entry may be before the breaking, as well as after; for by statute 12 Anne c. 7. if a person enters into the dwelling house of another, without breaking in either by day or by night, with an intent to commit felony, or, being in such house, shall commit any felony; and shall in the night break out of the same; this is declared to be burglary.

4. As to the *intent*; it is clear that such breaking and entry must be with a felonious intent, otherwise it is only a trespass. And it is the same, whether such intention be actually carried into execution, or only demonstrated by some attempt or overt act, of which the jury is to judge.

Burglary is a felony at common law, but within the benefit of clergy. Burglary in any house belonging to the plate-glass company, with intent to steal the stock or utensils, is by statute 13 Geo III. c. 38. declared to be single felony, and punished with transportation seven years.

BURGOMASTER, BURGERMASTER, *Burgermeister*, or *Burgemeister*, the chief magistrate of the great towns in Flanders, Holland, and Germany. The power and jurisdiction of the burgomaster is not the same in all places, every town having its particular customs and regulations: at Amsterdam there are four chosen by the voices of all those people in the senate who have either been burgomasters or scheyvins. They dispose of all under offices that fall in their time, keep the key of the bank, and enjoy a salary but of 500 guildres; all feasts, public entertainments, &c. being defrayed out of the common treasury. The word is formed from the two Flemish words, *berger*, *largefs*, or *citizen*; and *maister*, *maister*. Some express it in Latin by *consul*, others by *senator*.—M. Biuneau observes, that *burgemeister* in Holland, answers to what is called *alderman* and *sheriff* in England, *attorney* at Compe'gne, *cap. touz* at Th. louse, *consul* at Languedoc, &c.

BURGOO, or BURGOOR, a sea-faring dish, made of whole oatmeal, or groats, boiled in water till they burst; then mixed with butter. It is a cheap and strengthening diet. Burgoo, otherwise called *lebbly*, is held by Cockburn very proper to correct that thickens of humours and coarseness to which the other diet of sailors much disposes them. Yet the burgoo vicualling is the least liked of all their provisions, because

of the scanty allowance of butter to it. The same author thinks it might be worth the consideration of those to whom the care of the seamen is committed, to contrive to render this food more agreeable to them.

BURGOS, a city of Spain, the capital of Old Castile, with an archbishop's see, erected in 1574. It is surrounded with mountains, which render the air very cold nine months in the year, and the other three excessive hot. It is seated on the declivity of a hill, on the top of which there is a strong castle, and the lower part of the town is watered by the river Alagon. The principal avenue to the city is by a handsome bridge over this river, which leads to a beautiful gate, adorned with the statues of several kings of Spain. The town is large and populous; but the houses are ill built, and the streets are narrow and dirty, except some few, especially that which leads to the cathedral. There are several squares, adorned with fountains and statues. The great square in the middle of the city is surrounded with fine houses, with piazzas to each. The cathedral church is a master-piece of Gothic architecture, and one of the finest in all Spain. The church of the Augustines is remarkable for its beautiful and rich chapel of the holy crucifix. There are several fine convents and nunneries; one of which last contains 150 nuns, who must all be of noble extraction. They have likewise a royal hospital, very richly endowed; and at this place they speak the best Castilian, that is, the purest Spanish in the kingdom. W. Long. 4. 7. N. Lat. 42. 20.

BURGUNDIONES, a part or branch of the Vindili or Wardli. Cluverius places them about the Warta, a river of Poland: though the conjectures on the seat of these people are doubtful; and no wonder, because the Roman expeditions terminated at the Elbe. They afterwards removed to the Cisalpin, Germany, and at length to Celtic Gaul, and gave name to the duchy and county of Burgundy.

BURGUNDY, a province or government of France. It contains, besides the government of Burgundy, La Bresse, La Eugy, and the district of Gex; having Champagne on the north, Lyonnais on the south, Franche Comte on the east, and Nivernois and Bourbonnois on the west. Its length from north to south is about 45 leagues, and its breadth from east to west about 30. It is very fertile in corn, wine, fruit, and tobacco; being watered by the Seine, the Dehune which falls into the Soane, the Brebince or Bourbince, the Armançon, the Oucke, and the Tille. There are some noted mineral springs in it, with subterraneous lakes, and plenty of oehre. For a long time it had dukes of its own, subordinate to the crown of France; but at last, Louis XI. upon the failure of the heirs male, seized upon it, and annexed it to his crown. The whole government lies within the jurisdiction of the parliament of Burgundy, except a small part that is subject to that of Paris. The states meet regularly every three years, to raise the money required of them by the court. The principal places are Dijon, Auxerre, Autun, Bourbon, L'Ancy, &c.

BURIAL, the interment of a deceased person.

The rites of burial are looked upon in all countries, and at all times, as a debt so sacred, that such as neglected to discharge it were thought accursed: hence the

Burial. the Romans called them *justa*, and the Greeks *μυστα, δικαιο, σοια*, words implying the inviolable obligations which nature has laid upon the living to take care of the obsequies of the dead. Nor are we to wonder, that the ancient Greeks and Romans were extremely solicitous about the interment of their deceased friends, since they were strongly persuaded, that their souls could not be admitted into the Elysian fields till their bodies were committed to the earth; and if it happened that they never obtained the rites of burial, they were excluded from the happy mansions for the term of 100 years. For this reason it was considered as a duty incumbent upon all travellers who should meet with a dead body in their way, to cast dust or mould upon it three times; and of these three handfuls one at least was cast upon the head. The ancients likewise considered it as a great misfortune if they were not laid in the sepulchres of their fathers; for which reason, such as died in foreign countries had usually their ashes brought home, and interred with those of their ancestors. But notwithstanding their great care in the burial of the dead, there were some persons whom they thought unworthy of that last office, and to whom therefore they refused it: such were, 1. Public or private enemies. 2. Such as betrayed or conspired against their country. 3. Tyrants, who were always looked upon as enemies to their country. 4. Villains guilty of sacrilege. 5. Such as died in debt, whose bodies belonged to their creditors. And, 6. Some particular offenders, who suffered capital punishment.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment: thus persons killed by lightning were buried apart by themselves, being thought odious to the gods; those who wasted their patrimony forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty of self-murder were privately deposited in the ground, without the accustomed solemnities. Among the Jews, the privilege of burial was denied only to self-murderers, who were thrown out to rot upon the ground. In the Christian church, though good men always desired the privilege of interment, yet they were not, like the heathens, so concerned for their bodies, as to think it any detriment to them, if either the barbarity of an enemy, or some other accident, deprived them of this privilege. The primitive Christian church denied the more solemn rites of burial only to unbaptized persons, self-murderers, and excommunicated persons who continued obstinate and impenitent, in a manifest contempt of the church's censures.

The place of burial among the Jews was never particularly determined. We find they had graves in the town and country, upon the highways, in gardens, and upon mountains. Among the Greeks, the temples were made repositories for the dead in the primitive ages; yet the general custom in latter ages, with them, as well as with the Romans and other heathen nations, was to bury their dead without their cities, and chiefly by the highways. Among the primitive Christians, burying in cities was not allowed for the first 300 years, nor in churches for many ages after, the dead bodies being first deposited in the atrium or churchyard, and porches and porticos of the church: hereditary burying-places were forbidden till the 12th century. As to

the time of burial, with all the ceremonies accompanying it, see the article *Funeral-Rites*.

BURICK, a town of Germany, in the circle of Westphalia, and duchy of Cleves, subject to the king of Prussia. It was taken by the French in 1672, who demolished the fortifications. It is agreeably seated on the river Rhine, over against Wesel, in E. Long. 6. 8. N. Lat. 51. 28.

BURIDAN (John), a native of Betbune, in Artois, was one of the most celebrated philosophers of the 14th century. He taught in the university of Paris with great reputation; and wrote commentaries on logic, morality, and Aristotle's metaphysics. Aventinus relates, that he was a disciple of Ockam; and that, being expelled Paris by the power of the Realists, which was superior to that of the Nominalists, he went into Germany, where he founded the university of Vienna. From him came the proverb of the *ass of Buridan*, so famous in the schools. Buridan supposed an hungry ass fixed at an exactly equal distance between two bushels of oats; or an ass, as much pressed by thirst as hunger, between a bushel of oats and a pail of water, each of them acting equally on his senses. Having made this supposition, he desired to know what the ass would do? If he was answered that he would remain immoveable, then he concluded he would die of hunger between two bushels of oats, or of both hunger and thirst, with both corn and water within his reach. This appeared absurd, and brought the laughter on his side; but if it was replied, that the ass would not be so stupid as to die of hunger or thirst in such a situation, Then (said he), the ass has free will, or is it possible that of two equal weights one should outweigh the other? These two consequences appeared equally absurd; and thus Buridan, by this sophism, perplexed the philosophers, and his ass became famous in the schools.

BURKITT (William), a celebrated commentator on the New Testament, was born at Hitcham in Northamptonshire, July 25th 1650, and educated at Pembroke-hall, Cambridge. He entered young upon the ministry, being ordained by bishop Reynolds: and the first employment which he had was at Milden in Suffolk, where he continued 21 years a constant preacher, first as a curate, and afterwards as rector of that church. In the year 1692, he had a call to the vicarage of Dedham in Essex, where he continued to the time of his death, which happened in the latter end of October 1703. He was a pious and charitable man. He made great collections for the French Protestants in the years 1687, &c. and by his great care, pains, and charges, procured a worthy minister to go and settle in Carolina. Among other charities, by his last will and testament, he bequeathed the house wherein he lived, with the lands thereunto belonging, to be an habitation for the lecturer that should be chosen from time to time, to read the lecture at Dedham. Besides his Commentary upon the New Testament, written in the same plain, practical, and affectionate manner in which he preached, he wrote a volume, entitled, *The poor man's help, and rich man's guide*.

BURLAW. See *Br-Law*.

BURLEIGH. See *Cretl*.

BURLESQUE, a species of composition, which, though a great engine of ridicule, is not confined to

Burick
Burlique.

Burlesque
||
Burnet.

that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and burlesque that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain colouring so as to be risible, as in Virgil travestie; the author first laughs at every turn, in order to make his readers laugh. The *Lutrin* is a burlesque poem of the other sort, laying hold of a low and trifling incident to expose the luxury, indolence, and contentious spirit, of a set of monks. Boileau, the author, turns the subject into ridicule, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. Though ridicule is the poet's aim, he always carries a grave face, and never once betrays a smile. The opposition between the subject and the manner of handling it, is what produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to have quarter, because such images destroy the contrast.

Though the burlesque that aims at ridicule produces its effects by elevating the style far above the subject; yet the poet ought to confine himself to such images as are lively, and readily apprehended. A strained elevation, soaring above the ordinary reach of fancy, makes not a pleasant impression. The mind is soon disgusted by being kept long on the stretch. Machinery may be employed in a burlesque poem, such as the *Lutrin*, the *Dispensary*, or *Hudibras*, with more success and propriety than in any other species of poetry. For burlesque poems, though they assume the air of history, give entertainment chiefly by their pleasant and ludicrous pictures: it is not the aim of such a poem to raise sympathy; and for that reason, a strict imitation of nature is not necessary. And hence, the more extravagant the machinery in a ludicrous poem, the more entertainment it affords.

BURLINGTON, a sea-port town in the east riding of Yorkshire, situated on the German ocean, about 37 miles north-east of York. E. Long. 10. and N. Lat. 54. 15. It gave the title of *earl* to a branch of the noble family of Boyle, but the earldom is now extinct.

New BURLINGTON, the capital of New-Jersey, in North America; situated in an island of Delawar river, about 20 miles north of Philadelphia. W. Long. 74. 0. N. Lat. 40. 40.

BURMAN (Francis), a Protestant minister, and learned professor of divinity at Utrecht, was born at Leyden in 1628; and died on the 10th of November 1679, after having published a course of divinity, and several other works.

He is not to be confounded with *Francis Burman*, his son; or with *Peter Burman*, a laborious commentator on Phædrus, Lucan, Petronius, and other profane authors, who died in 1741.

BURN, in medicine and surgery, an injury received in any part of the body by fire. See **SURGERY**.

BURNET (Gilbert), bishop of Salisbury in the latter end of the 16th century, was born at Edinburgh, in 1643, of an ancient family in the shire of Aberdeen. His father being bred to the law, was, at the restoration of king Charles II. appointed one of the lords of session, with the title of *lord Crimond*, in reward for his constant attachment to the royal party during the troubles of Great Britain. Our author, the youngest son

of his father, was instructed by him in the Latin tongue: at ten years of age he was sent to continue his studies at Aberdeen, and was admitted M. A. before he was 14. His own inclination led him to the study of the civil and feudal law; and he used to say, that it was from this study he had received more just notions concerning the foundations of civil society and government, than those which some divines maintain. About a year after, he changed his mind, and began to apply to divinity, to the great satisfaction of his father. He was admitted preacher before he was 18; and Sir Alexander Burnet, his cousin-german, offered him a benefice; but he refused to accept of it.

In 1663, about two years after the death of his father, he came into England; and after six months stay at Oxford and Cambridge, returned to Scotland; which he soon left again to make a tour for some months, in 1664, in Holland and France. At Amsterdam, by the help of a Jewish rabbi, he perfected himself in the Hebrew language; and likewise became acquainted with the leading men of the different persuasions tolerated in that country; as Calvinists, Arminians, Lutherans, Anabaptists, Brownists, Papists, and Unitarians; amongst each of which he used frequently to declare, he met with men of such unfeigned piety and virtue, that he became fixed in a strong principle of universal charity, and an invincible abhorrence of all severities on account of religious dissensions.

Upon his return from his travels, he was admitted minister of Salton; in which station he served five years in the most exemplary manner. He drew up a memorial, in which he took notice of the principal errors in the conduct of the Scots bishops, which he observed not to be conformable to the primitive institution; and sent a copy of it to several of them. This exposed him to their resentments: but, to show he was not actuated with a spirit of ambition, he led a retired course of life for two years; which so endangered his health, that he was obliged to abate his excessive application to study. In 1669, he published his "Modest and free conference between a conformist and non-conformist." He became acquainted with the duchess of Hamilton, who communicated to him all the papers belonging to her father and her uncle; upon which he drew up the "Memoirs of the dukes of Hamilton." The duke of Lauderdale, hearing he was about this work, invited him to London, and introduced him to king Charles II. He returned to Scotland, and married the lady Margaret Kennedy, daughter of the earl of Cassilis; a lady of great piety and knowledge, highly esteemed by the presbyterians, to whose sentiments she was strongly inclined. As there was some disparity in their ages, that it might remain past dispute that this match was wholly owing to inclination, and not to avarice or ambition, the day before their marriage our author delivered the lady a deed, whereby he renounced all pretensions to her fortune, which was very considerable, and must otherwise have fallen into his hands, she herself having no intention to secure it. The same year he published his "Vindication of the authority, constitution, and laws of the church and state of Scotland;" which at that juncture was looked upon as so great a service, that he was again offered a bishopric, and a promise of the next vacant archbishopric; but

Burnet.

Burnet. but did not accept of it, because he could not approve of the measures of the court, the grand view of which he saw to be the advancement of popery.

Mr Burnet's intimacy with the duke of Hamilton and Lauderdale occasioned him to be frequently sent for by the king and the duke of York, who had conversations with him in private. But Lauderdale conceiving a resentment against him on account of the freedom with which he spoke to him, represented at last to the king, that Dr Burnet was engaged in an opposition to his measures. Upon his return to London, he perceived that these suggestions had entirely thrown him out of the king's favour, though the duke of York treated him with greater civility than ever, and dissuaded him from going to Scotland. Upon this, he resigned his professorship at Glasgow, and staid at London. About this time the living at Cripple-gate being vacant, the dean and chapter of St Paul's (in whose gift it was), hearing of his circumstances, and the hardships he had undergone, sent him an offer of the benefice; but as he had been informed of their first intention of conferring it on Dr Fowler, he generously declined it. In 1675, at the recommendation of lord Hollis, whom he had known in France, ambassador at that court, he was, by Sir Herbottle Grimstone, master of the rolls, appointed preacher of the chapel there, notwithstanding the opposition of the court. He was soon after chosen a lecturer of St Clement's, and became one of the preachers that were most followed in town. In 1697, he published his *History of the reformation*, for which he had the thanks of both houses of parliament. The first part of it was published in 1679, and the second in 1681. Next year he published an abridgement of these two parts.

Mr Burnet about this time happened to be sent for to a woman in sickness, who had been engaged in an amour with the earl of Rochester. The manner in which he treated her during her illness, gave that lord a great curiosity for being acquainted with him. Whereupon, for a whole winter, he spent one evening in a week with Dr Burnet, who discoursed with him upon all those topics upon which sceptics and men of loose morals attack the Christian religion. The happy effect of these conferences occasioned the publication of his account of the life and death of that earl. In 1682, when the administration was changed in favour of the duke of York, being much resorted to by persons of all ranks and parties, in order to avoid returning visits, he built a laboratory, and went for above a year through a course of chemical experiments. Not long after, he refused a living of 300l. a-year offered him by the earl of Essex, on the terms of his not residing there, but in London. When the inquiry concerning the popish plot was on foot, he was frequently sent for and consulted by king Charles with relation to the state of the nation. His majesty offered him the bishopric of Chichester, then vacant, if he would engage in his interests; but he refused to accept it on these terms. He preached at the Rolls till 1684, when he was dismissed by order of the court. About this time he published several pieces.

On king James's accession to the throne, having obtained leave to go out of the kingdom, he first went to Paris, and lived in great retirement, till contracting an acquaintance with brigadier Stoupe, a Protestant

gentleman in the French service, he made a tour with him into Italy. He met with an agreeable reception at Rome. Pope Innocent II. hearing of our author's arrival, sent the captain of the Swiss guard, to acquaint him he would give him a private audience in bed, to avoid the ceremony of kissing his holiness's slipper. But Dr Burnet excused himself as well as he could. Some disputes which our author had here concerning religion, beginning to be taken notice of, made it proper for him to quit the city; which, upon an intimation given him by prince Borghese, he accordingly did.

He pursued his travels through Switzerland and Germany. In 1688, he came to Utrecht, with an intention to settle in some of the seven provinces. There he received an invitation from the prince and princess of Orange (to whom their party in England had recommended him) to come to the Hague, which he accepted. He was soon made acquainted with the secret of their counsels, and advised the fitting out of a fleet in Holland sufficient to support their designs and encourage their friends. This, and the *Account of his travels*, in which he endeavoured to blend Popery and tyranny together, and represent them as inseparable, with some papers reflecting on the proceedings of England, that came out in single sheets, and were dispersed in several parts of England, most of which Mr Burnet owned himself the author of, alarmed king James; and were the occasion of his writing twice against him to the princess of Orange, and insinuating, by his ambassador, on his being forbid the court; which, after much importunity, was done, though he continued to be trusted and employed as before, the Dutch minister consulting him daily. To put an end to these frequent conferences with the ministers, a prosecution for high treason was set on foot against him both in England and Scotland. But Burnet receiving the news thereof before it arrived at the States, he avoided the storm, by petitioning for, and obtaining without any difficulty, a bill of naturalization, in order to his intended marriage with Mary Scot, a Dutch lady of considerable fortune, who, with the advantage of birth, had those of a fine person and understanding.

After his marriage with this lady, being legally under the protection of Holland, when Mr Burnet found king James plainly subverting the constitution, he omitted no method to support and promote the design the prince of Orange had formed of delivering Great Britain, and came over with him in quality of chaplain. He was soon advanced to the see of Salisbury. He declared for moderate measures with regard to the clergy who scrupled to take the oaths, and many were displeas'd with him for declaring for the toleration of nonconformists. His pastoral letter concerning the oaths of allegiance and supremacy to king William and queen Mary, 1689, happening to touch upon the right of conquest, gave such offence to both houses of parliament, that it was ordered to be burnt by the hands of the common executioner. In 1698 he lost his wife by the small-pox; and, as he was almost immediately after appointed preceptor to the duke of Gloucester, in whose education he took great care, this employment, and the tender age of his children, induced him the same year to supply her loss by a marriage with Mrs Berkeley,

ly, eldest daughter of Sir Richard Blake, knight. In 1699 he published his Exposition of the 39 articles; which occasioned a representation against him in the lower house of convocation in the year 1701; but he was vindicated by the upper house. His speech in the house of lords in 1704 against the bill to prevent occasional conformity was severely attacked. He died in 1715, and was interred in the church of St James, Clerkenwell, where he has a monument erected to him. He formed a scheme for augmenting the poor livings; which he pressed forward with such success, that it ended in an act of parliament passed in the 2d year of queen Anne, "for the augmentation of the livings of the poor clergy."

BURNET (Thomas), a polite and learned writer in the end of the 17th century, was born in Scotland, but educated in Cambridge under the tuition of Mr John Tillotson, afterwards archbishop of Canterbury. In the beginning of 1685, he was made master of Sutton's hospital in London, after which he entered into holy orders. During the reign of king James, he made a noble stand in his post as master of the charter-house against the encroachments of that monarch, who would have imposed one Andrew Popham, a Papist, as a pensioner upon the foundation of that house. In 1685 he published his *Telluris theoria sacra*, so universally admired for the purity of the style and beauty of the sentiments, that king Charles gave encouragement to a translation of it into English. This theory was however attacked by several writers. In 1692 he published his *Archæologia philisophica*, dedicated to king William, to whom he was clerk of the closet. He died in 1715. Since his death hath been published, his book *De statu mortuorum et resurgentium*, and his treatise *De fide et officis Christianorum*.

BURNET, in botany. See POTERIUM and SANGUISORBA.

BURNHAM, a market town of Norfolk in England, situated in E. Long. o. 50. N. Lat. 53. o.

BURNING, the action of fire on some pabulum or fuel, by which the minute parts thereof are put into a violent motion, and some of them assuming the nature of fire themselves, fly off *in orbem*, while the rest are dissipated in form of vapour or reduced to ashes. See IGNITION.

Extraordinary Cases of BURNING. We have instances of persons burnt by fire kindled within their own bodies. A woman at Paris, who used to drink brandy to excess, was one night reduced to ashes by a fire from within, all but her head and the ends of her fingers. Signora Corn. Zangari, or, as others call her, *Corn. Bandi*, an aged lady, of an unblemished life, near Cesena in Romagna, underwent the same fate in March 1731. She had retired in the evening into her chamber somewhat indisposed; and in the morning was found in the middle of the room reduced to ashes, all except her face, legs, skull, and three fingers. The stockings and shoes she had on were not burnt in the least. The ashes were light; and, on pressing between the fingers, vanished, leaving behind a gross stinking moisture with which the floor was smeared; the walls and furniture of the room being covered with a moist cineritious soot, which had not only stained the linen in the chests, but had penetrated into the closet, as well as into the room overhead, the walls of which were moistened with

the same viscous humour.—We have various other relations of persons burnt to death in this unaccountable manner.

Burnng.

Sig. Mondini, Bianchini, and Maffei, have written treatises express to account for the cause of so extraordinary an event: common fire it could not be, since this would likewise have burnt the bed and the room; besides that it would have required many hours, and a vast quantity of fuel, to reduce a human body to ashes; and, after all, a considerable part of the bones would have remained entire, as they were anciently found after the fiercest funeral fires. Some attribute the effect to a mine of sulphur under the house; others, to a miracle; while others suspect that art or villany had a hand in it. A philosopher of Verona maintains, that such a conflagration might have arisen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for the conflagration of the lady above mentioned, from her using a bath or lotion of camphorated spirit of wine when she found herself out of order. Maffei supposes it owing to lightning, but to lightning generated in her own body, agreeable to his doctrine, which is, That lightning does not proceed from the clouds, but is always produced in the place where it is seen and its effects perceived. We have had a late attempt to establish the opinion, that these destroying internal fires are caused in the entrails of the body by inflamed effluvia of the blood; by juices and fermentations in the stomach; by the many combustible matters which abound in living bodies for the purposes of life; and, finally, by the fiery evaporations which exhale from the settlings of spirit of wine, brandies, and other hot liquors, in the tunica villosa of the stomach and other adipose or fat membranes; within which those spirits engender a kind of camphor, which in the night-time, in sleep, by a full respiration, are put in a stronger motion, and are more apt to be set on fire. Others ascribe the cause of such persons being set on fire to lightning; and their burning so entirely, to the greater quantity of phosphorus and other combustible matter, they contained.—For our own part, we can by no means pretend to explain the cause of such a phenomenon: but for the interests of humanity we wish it could be derived from something external to the human body; for if, to the calamities of human life already known, we superadd a suspicion that we may unexpectedly and without the least warning be consumed by an *internal* fire, the thought is too dreadful to be borne.

BURNING, or *Brenning*, in our old customs, denotes an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the *venereal disease*.

In a manuscript of the vocation of John Bale to the bishopric of Ossory, written by himself, he speaks of Dr Hugh Weston, who was dean of Windfor in 1556, but deprived by cardinal Pole for adultery, thus: "At this day is lecherous Weston, who is more practised in the arts of breech-burning, than all the whores of the stews. He not long ago burnt a beggar of St Botolph's parish." See STEWS.

BURNING, in antiquity, a way of disposing of the dead much practised by the ancient Greeks and Romans, and still retained by several nations in the East and West Indies. The antiquity of this custom

Burning.

Burning.

rises as high as the Theban war, where we are told of the great solemnity accompanying this ceremony at the pyre of Menæceus and Archemorus, who were contemporary with Jair the eighth judge of Israel. Homer abounds with funeral obsequies of this nature. In the inward regions of Asia, the practice was of very ancient date, and the continuance long: for we are told, that, in the reign of Julian, the king of Chionia burnt his son's body, and deposited the ashes in a silver urn. Coeval almost with the first instances of this kind in the east, was the practice in the western parts of the world. The Herulians, the Getes, and the Thracians, had all along observed it; and its antiquity was as great with the Celts, Sarmatians, and other neighbouring nations. The origin of this custom seems to have been out of friendship to the deceased: their ashes were preserved as we preserve a lock of hair, a ring, or a seal, which had been the property of a deceased friend.

Kings were burnt in cloth made of the asbestos stone, that their ashes might be preserved pure from any mixture with the fuel and other matters thrown on the funeral pile. The same method is still observed with the princes of Tartary. Among the Greeks, the body was placed on the top of a pile, on which were thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus we find a number of sheep and oxen thrown in, then four horses, followed by two dogs, and lastly by 12 Trojan prisoners. The like is mentioned by Virgil in the funerals of his Trojans; where, besides oxen, swine, and all manner of cattle, we find eight youths condemned to the flames. The first thing was the fat of the beasts wherewith the body was covered, that it might consume the sooner; it being reckoned great felicity to be quickly reduced to ashes. For the like reason, where numbers were to be burnt at the same time, care was taken to mix with the rest some of humid constitutions, and therefore more easily to be inflamed. Thus we are assured by Plutarch and Macrobius, that for every ten men it was customary to put in one woman. Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile, with other ornaments and presents; a piece of extravagance which the Athenians carried to so great a height, that some of the law-givers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead.—In some cases, burning was expressly forbid among the Romans, and even looked upon as the highest impiety. Thus infants, who died before the breeding of teeth, were intombed unburnt in the ground, in a particular place set apart for this purpose, called *suggranularium*. The like was practised with regard to those who had been struck dead with lightning, who were never to be burnt again. Some say that burning was denied to suicides.—The manner of burning among the Romans was not unlike that of the Greeks: the corpse, being brought out without the city, was carried directly to the place appointed for burning it; which, if it joined to the sepulchre, was called *hustum*; if separate from it, *ustina*; and there laid on the *rogus* or *pyra*, a pile of wood prepared on which to burn it, built in shape of an altar, but of different height according to the quality of the deceased. The wood used was commonly from such trees as contain most pitch or resin; and if any other were used,

they split it for the more easy catching fire: round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on the couch or bed whereon it lay. This done, the next of blood performed the ceremony of lighting the pile; which they did with a torch, turning their faces all the while the other way, as if it were done with reluctance. During the ceremony, deceptions and games were celebrated; after which came the *offitium*, or gathering of the bones and ashes; also walking and anointing them, and repositing them in urns.

BURNING, among surgeons, denotes the application of an actual cautery, that is, a red-hot iron instrument, to the part affected; otherwise denominated *cauterization*.—The whole art of physic among the Japanese lies in the choice of places proper to be burnt; which are varied according to the disease. In the country of the Mogul, the colic is cured by an iron ring applied red-hot about the patient's navel. Certain it is, that some very extraordinary cures have been performed accidentally by burning. The following case is recorded in the Memoires of the academy of sciences by M. Homberg. A woman of about 35 became subject to a head-ach, which at times was so violent, that it drove her out of her senses, making her sometimes stupid and foolish, at other times raving and furious. The seat of the pain was in the forehead, and over the eyes, which were inflamed, and looked violently red and sparkling; and the most violent fits of it were attended with nausea and vomitings. In the times of the fits, she could take no food; but, out of them, had a very good stomach. Mr Homberg had in vain attempted her cure for three years with all kinds of medicines: only opium succeeded; and that but little, all its effect being only the taking off the pain for a few hours. The redness of her eyes was always the sign of an approaching fit. One night, feeling a fit coming on, she went to lie down upon the bed; but first walked up to the glass with the candle in her hand, to see how her eyes looked: in observing this, the candle set fire to her cap; and as she was alone, her head was terribly burnt before the fire could be extinguished. Mr Homberg was sent for, and ordered bleeding and proper dressings; but it was perceived, that the expected fit this night never came on; the pain of the burning wore off by degrees; and the patient found herself from that hour cured of the head-ach, which had never returned in four years after, which was the time when the account was communicated.—Another case, not less remarkable than the former, was communicated to Mr Homberg by a physician at Bruges. A woman, who for several years had her legs and thighs swelled in an extraordinary manner, found some relief from rubbing them before the fire with brandy every morning and evening. One evening the fire chanced to catch the brandy she had rubbed herself with, and slightly burnt her. She applied some brandy to her burn; and in the night all the water her legs and thighs were swelled with was entirely discharged by urine, and the swelling did not again return.

BURNING Eyeb. See BUSH.

BURNING Glass, a convex glass commonly spherical, which being exposed directly to the sun, collects all the rays falling thereon into a very small space called the *fo-*

Burning. *cur*; where wood or any other combustible matter being put, will be set on fire. The term *burning glass* is also used to denote those concave mirrors, whether composed of glass quick-silvered, or of metalline matters, which burn by reflection, condensing the sun's rays into a focus similar to the former.

The use of burning-glasses appears to have been very ancient. Diodorus Siculus, Lucian, Dion, Zonaras, Galen, Anthemius, Eustathius, Tzetzes, and others, attest, that by means of them Archimedes set fire to the Roman fleet at the siege of Syracuse. Tzetzes is so particular in his account of this matter, that his description suggested to Kircher the method by which it was probably accomplished. That author says, that "Archimedes set fire to Marcellus's navy, by means of a burning-glass composed of small square mirrors, moving every way upon hinges; which, when placed in the sun's rays, directed them upon the Roman fleet, so as to reduce it to ashes at the distance of a bow-shot." A very particular testimony we have also from Anthemius of Lydia, who takes pains to prove the possibility of setting fire to a fleet, or any other combustible body, at such a distance.

That the ancients were also acquainted with the use of catoptric or refracting burning-glasses, appears from a passage in Aristophanes's comedy of the clouds, which clearly treats of their effects. The author introduces Socrates as examining Strepsiades about the method he had discovered of getting clear of his debts. He replies, that "he thought of making use of a burning-glass which he had hitherto used in kindling his fire;" "for (says he) should they bring a writ against me, I'll immediately place my glass in the sun at some little distance from it, and set it on fire." Pliny and Lactantius have also spoken of glasses that burnt by refraction. The former calls them *balls* or *globes of glass* or *crystal*, which, exposed to the sun, transmit a heat sufficient to set fire to cloth, or corrode the dead flesh of those patients who stand in need of caustics; and the latter, after Clemens Alexandrinus, takes notice that fire may be kindled by interposing glasses filled with water between the sun and the object, so as to transmit the rays to it.

It seems difficult to conceive how they should know such glasses would burn without knowing they would magnify, which it is granted they did not, till towards the close of the 13th century, when spectacles were first thought on. For as to those passages in Plautus which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing; and he solves this, by observing, that their burning-glasses being spheres, either solid or full of water, their foci would be one-fourth of their diameter distant from them. If then their diameter were supposed half a foot, which is the most we can allow, an object must be at an inch and a half distance to perceive it magnified; those at greater distances do not appear greater, but only more confused through the glass than out of it. It is no wonder, therefore, the magnifying property of convex glasses was unknown, and the burning one known. It is more wonderful there should be 300 years between the invention of spectacles and telescopes.

Among the ancients, the burning mirrors of Archimedes and Proclus are famous: the former we have already taken notice of; by the other, the navy of Vi-

tellius besieging Byzantium, according to Zonaras, was burnt to ashes. *Burning.*

Among the moderns, the most remarkable burning mirrors are those of Settala, of Villette, of Tschirnhausen, of Buffon, of Trudaine, and of Parker.

Settala, canon of Padua, made a parabolic mirror, which, according to Schottus, burnt pieces of wood at the distance of 15 or 16 paces. The following things are noted of it in the *Acta Eruditorum*. 1. Green wood takes fire instantaneously, so as a strong wind cannot extinguish it. 2. Water boils immediately; and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently; and iron and steel plate becomes red-hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red-hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass, and shells into a blackish yellow one. 7. A pumice stone, emitted from a volcano, melts into white glass; and, 8. A piece of crucible also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one. The breadth of this mirror is near three Leipzig ells, and its focus two ells from it; it is made of copper, and its substance is not above double the thickness of the back of a knife.

Villette, a French artist of Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third, presented by the French king to the royal academy; a fourth has been in England, where it was publicly exposed. The effects hereof, as found by Dr Harris and Dr Desaguliers, are, that a silver sixpence is melted in 7" and $\frac{1}{2}$, a king George's halfpenny in 16", and runs with a hole in 34". Tin melts in 3', cast iron in 16', slate in 3'; a fossil shell calcines in 7'; a piece of Pompey's pillar at Alexandria vitrifies the black part in 50', in the white in 54"; copper ore in 8'; bone calcines in 4', vitrifies in 33". An emerald melts into a substance like a torquois stone; a diamond weighing four grains loses $\frac{2}{3}$ of its weight: the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can go no farther with them. This mirror is 47 inches wide, and is ground to a sphere of 76 inches radius; so that its focus is about 38 inches from the vertex. Its substance is a composition of tin, copper, and tin-glass.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a burning-glass. The most considerable of this kind is that made by M. de Tschirnhausen: the diameters of his lenses are three and four feet, the focus at the distance of 12 feet, and its diameter an inch and a half. To make the focus the more vivid, it is collected a second time by a second lens parallel to the first, and placed in that point where the diameter of the cone of rays formed by the first lens is equal to the diameter of the second; so that it receives them all; and the focus, from an inch and a half, is contracted into the space of eight lines, and its force increased proportionably.

This glass vitrifies tiles, slates, pumice-stones, &c. in a moment. It melts sulphur, pitch, and all resins, under

Burning. under water; the ashes of vegetables, woods, and other matters, are transmuted into glass; and every thing applied to its focus is either melted, turned into a calx, or into smoke. Tschirnhausen observes, that it succeeds best when the matter applied is laid on a hard charcoal well burnt.

Sir Isaac Newton presented a burning-glass to the royal society, consisting of seven concave glasses, so placed, as that all their foci join in one physical point. Each glass is about 11 inches and a half in diameter: six of them are placed round the seventh, to which they are all contiguous; and they form a kind of segment of a sphere, whose subtense is about 34 inches and a half, and the central glass lies about an inch farther in than the rest. The common focus is about 22 inches and a half distant, and about an inch in diameter. This glass vitrifies brick or tile in 1", and melts gold in 30".

It would appear, however, that glass quicksilvered is a more proper material for burning-glasses than metals; for the effects of that speculum wherewith Mr Macquer melted the platina, seem to have been superior to those above mentioned, though the mirror itself was much smaller. The diameter of this glass was only 22 inches, and its focal distance 28. Black flint, when exposed to the focus, being powdered to prevent its crackling and flying about, and secured in a large piece of charcoal, bubbled up and ran into transparent glass in less than half a minute. Ilesian crucibles, and glass-house pots, vitrified completely in three or four seconds. Forged iron smoked, boiled, and changed into a vitrescent scoria as soon as it was exposed to the focus. The gypsum of Montmartre, when the flat sides of the plates or leaves of which it is composed were presented to the glass, did not show the least disposition to melt; but, on presenting a transverse section of it, or the edges of the plates, it melted in an instant, with a hissing noise, into a brownish yellow matter. Calcareous stones did not completely melt; but there was detached from them a circle more compact than the rest of the mats, and of the size of the focus; the separation of which seemed to be occasioned by the shrinking of the matter which had begun to enter into fusion. The white calx of antimony, commonly called *diaphoretic antimony*, melted better than the calcareous stones, and changed into an opaque pretty glossy substance like white enamel. It was observed, that the whiteness of the calcareous stones and the antimonial calx was of great disadvantage to their fusion, by reason of their reflecting great part of the sun's rays; so that the subject could not undergo the full activity of the heat thrown upon it by the burning-glass. The case was the same with metallic bodies, which melted so much the more difficultly as they were more white and polished; and this difference was so remarkable, that in the focus of this mirror, so fusible a metal as silver, when its surface was polished, did not melt at all.

Plate CIX. fig. 3. represents M. Buffon's burning mirror, which he with great reason supposes to be of the same nature with that of Archimedes. It consists of a number of small mirrors of glass quicksilvered, all of which are held together by an iron frame. Each of these small mirrors is also moveable by a contrivance on the back part of the frame, that so their reflections

may all coincide in one point. By this means they are capable of being accommodated to various heights of the sun, and to different distances. The adjusting them in this manner takes up a considerable time; but after they are so adjusted, the focus will continue unaltered for an hour or more.

Fig. 4. represents a contrivance of M. Buffon's for diminishing the thickness of very large refracting lenses. He observes, that in large lenses of this kind, and which are most convenient for many purposes, the thickness of the glass in the middle is so great, as very much to diminish their force. For this reason he proposes to form a burning-glass of concentric circular pieces of glass, each resting upon the other, as represented in the figure. His method is to divide the convex arch of the lens into three equal parts. Thus, suppose the diameter to be 26 inches, and the thickness in the middle to be three inches: By dividing the lens into three concentric circles, and laying the one over the other, the thickness of the middle piece needs be only one inch; at the same time that the lens will have the same convexity, and almost the same focal distance, as in the other case; while the effects of it must be much greater, on account of the greater thinness of the glass.

M. Trudaine, a French gentleman, constructed a burning lens on a new principle. It was composed of two circular segments of glass spheres, each four feet in diameter, applied with their concave sides towards each other. The cavity was filled with spirit of wine, of which it contained 40 pints. It was presented by the maker to the royal academy of sciences, but was, not long after, broken by accident. The expence of constructing it amounted to about 1000l. sterling. After all, it does not appear that the effects of this lens were very great. Mr Magellan informs us, that it could only coagulate the particles of platina in 20 minutes, while Mr Parker's lens entirely melted them in less than two.

A large burning lens, indeed, for the purpose of fusing and vitrifying such substances as resist the fires of ordinary furnaces, and especially for the application of heat in vacuo, and in other circumstances in which heat cannot be applied by any other means, has long been a desideratum: among persons concerned in philosophical experiments: And it appears now to be in a great degree accomplished by Mr Parker. His lens is three feet in diameter, made of flint glass, and which, when fixed in its frame, exposes a surface two feet eight inches and a half in the clear.

In the *Elevation* represented on the plate, A is the lens of the diameter mentioned: thickness in the centre, 3 inches and one fourth; weight, 212 pounds; length of the focus, 6 feet 8 inches; diameter of ditto, 1 inch. B, a second lens, whose diameter in the frame is 16 inches, and flows in the clear 13 inches; thickness in the centre, 1 inch five-eighths; weight 21 pounds; length of focus, 27 inches; diameter of ditto, three-eighths of an inch. When the two above lenses are compounded together, the length of the focus is 5 feet 3 inches; diameter of ditto, half a inch. C, a truncated cone, composed of 21 ribs of wood; at the larger end is fixed the great lens A, at the smaller extremity the lesser lens B; near the smaller end is also fixed a rack, D, passing through the pillar E, moveable by a pinion turning in the said pillar, by means,

Burning. means of the handle E, and thus giving a vertical motion to the machine. F, a bar of wood, fixed between the two lower ribs of the cone at G; having, within a chaced mortice in which it moves, an apparatus, H, with the iron plate, I, fixed thereto; and this part turning on a ball and socket, K, a method is thereby obtained of placing the matter under experiment, so as to be acted upon by the focal rays in the most direct and powerful manner. LL, a strong mahogany frame, moving on casters, MM. Immediately under the table N are three friction wheels, by which the machine moves horizontally. O, a strong iron bow, in which the lens and the cone hang.

Section. a, The great lens marked A in the elevation. b, The frame which contains the lens. c, The small lens marked B. d, The frame which contains the small lens. e, The truncated cone, marked C. f, The bar on which the apparatus marked F moves. g, The iron plate marked I. h, The cone of rays formed by the refraction of the great lens a, and falling on the lens c. i, The cone of rays formed by the refraction of the lens c. *Front-view.* k, The great lens. l, The frame containing it. m, The strong iron bow in which it hangs.

From a great number of experiments made with this lens, in the presence of many scientific persons, the following are selected as specimens of its powers.

BURNING Mountains. See *ÆTNA*, *ETNA*, *HECLA*, *VESUVIUS*, and *VOLCANO*, with the plates accompany ing them.

BURNING Springs. Of these there are many in different parts of the world; particularly one in Dauphiny near Grenoble; another near Hermanstadt in Transylvania; a third at Chermay, a village near Switzerland; a fourth in the canton of Friburg; and a fifth not far from the city of Cracow in Poland. There also is, or was, a famous spring of the same kind at Wigan in Lancashire, which, upon the approach of a lighted candle, would take fire and burn like spirit of wine for a whole day. But the most remarkable one of this kind, or at least that of which we have the most particular description, was discovered in 1711 at Brofely in Shropshire. The following account of this remarkable spring was given by the reverend Mr Mason Woodwardian professor at Cambridge, dated February 18th 1746. "The well for four or five feet deep is six or seven feet wide; within that is another less hole of like depth dug in the clay, in the bottom whereof is placed a cylindric earthen vessel, of about four or five inches diameter at the mouth, having the bottom taken off, and the sides well fixed in the clay rammed close about it. Within the pot is a brown water, thick as puddle, continually forced up with a violent motion beyond that of boiling water, and a rumbling hollow noise, rising or falling by fits five or six inches; but there was no appearance of any vapour rising, which perhaps might have been visible, had not the sun shone so bright. "Upon putting a candle down at the end of a stick, at about a quarter of a yard distance, it took fire, darting and flashing after a very violent manner for about half a yard high, much in the manner of spirits in a lamp, but with great agitation. It was said, that a tea-kettle had been made to boil in about nine minutes time, and that it had been left burning for 48 hours without any sensible diminution. It was extinguished by putting a wet mop upon it; which must be kept there for a little time, otherwise it would not go out. Upon the removal of the mop there arises a sulphureous smoke lasting about a minute, and yet the water is very cold to the touch." In 1755, this well totally disappeared by the sinking of a coal-pit in its neighbourhood.

The cause of the inflammable property of such waters, is with great probability supposed to be their mixture with petroleum, which is one of the most inflammable substances in nature, and has the property of burning on the surface of water.

BURNING of Colours, among painters. There are several colours that require burning; as,

First, *Lamp-black*, which is a colour of so greasy a nature, that, except it is burnt, it will require a long time to dry. The method of burning, or rather drying, lamp-black, is as follows: Put it into a crucible over a clear fire, letting it remain till it be red hot, or so near it that there is no manner of smoke arises from it.

Secondly, *Umber*, which if it be intended for colour for a horse, or to be a shadow for gold, then burning fits it for both these purposes. In order to burn umber, you must put it into the naked fire, in large lumps, and not take it out till it is thoroughly red hot; if you have a mind to be more curious, put it into a crucible, and keep it over the fire till it be red hot.

Ivory also must be burnt to make black, thus: fill

two crucibles with shavings of ivory, then clap their two mouths together, and bind them fast with an iron wire, and lute the joints close with clay, salt, and horse-dung, well beaten together; then set it over the fire, covering it all over with coals; let it remain in the fire till you are sure that the matter inclosed is thoroughly red-hot: then take it out of the fire; but do not open the crucibles till they are perfectly cold; for were they opened while hot, the matter would turn to ashes; and so it will be if the joints are not luted close.

BURNISHER, a round polished piece of steel, serving to smooth and give a lustre to metals.

Of these there are different kinds of different figures, straight, crooked, &c. Half burnishers are used to solder silver, as well as to give a lustre.

Burnishers for gold and silver are commonly made of a dog's or wolf's tooth, set in the end of an iron or wooden handle. Of late, agates and pebbles have been introduced, which many prefer to the dog's tooth.

The burnishers used by engravers in copper, usually serve with one end to burnish and with the other to scrape.

BURNISHING, the art of smoothing or polishing a metalline body, by a brisk rubbing of it with a burnisher.

Book-binders burnish the edges of their books, by rubbing them with a dog's tooth.

BURNLEY, a town of Lancashire in England, situated in W. Long. 2. 5. N. Lat. 51. 38.

BURNPISLAND. See **BRUNTSISLAND**.

BURNWOOD, a town of Essex in England, situated on a hill, in E. Long. 0. 25. N. Lat. 51. 38.

BURR, the round knob of a horn next a deer's head.

BURRE, **BOUREE**, or *Berne*, a kind of dance composed of three steps joined together in two motions, begun with a crotchet rising. The first couplet contains twice four measures, the second twice eight. It consists of a balance and coupeé.

BURR PUMP, or *Bulge Pump*. See **BILGEE**.

BURROCK, a small weir, or dam, where wheels are laid in a river, for the taking of fish.

BURROUGHS'S MACHINE, invented by Mr Burroughs of Southwark, and for which the society for the encouragement of arts gave him a premium of L. 50.

This machine consists of a cog wheel A (fig. 5.), 12 feet in diameter, carrying 72 cogs; which turn a triangle-head B, one foot four inches in diameter, and furnished with eight rounds; and also an horizontal spur wheel C, of 12 cogs, and one foot eight inches in diameter. The triangle-head B turns a spur wheel D of ten cogs, and two feet eight inches in diameter. This spur-wheel has two cranks, *a* & *b*, in its shaft; one of which *a* gives motion to a wooden frame *e*, about 34 inches long and 19 broad. On the under side of this frame are fastened by screws twelve pieces of polished metal, each five inches and a half long, and three broad, covered with leather; and underneath these polishers, a glass plate cemented in another frame is placed on the bench *d*, and polished with tripoli by the motion given to the upper frame by the crank *a*. The nuts of the screws which fasten the polishers to the upper frame are not screwed close to the wood, in order to give the frame room to play; by which contrivance the perpendicular rite of the crank is avoided, and the motion of the polishers always parallel and equal. The under frame may be moved by the hand in any direc-

tion without stopping the machine; by which means the plate, when larger than the polishing frame can cover in its motion, will be equally polished in every part.

The other crank *b* gives motion to two other polishers marked *n*, *o*, which have an alternate motion by the bending of the crank; they move upon the same plate, and have an equal number of polishers as that already described.

The same crank also gives motion to a contrivance represented at *e* for polishing spectable-glasses. It consists of two segments of the same sphere: one concave and the other convex. On the latter the glasses are cemented; and polished by the form *r*, which is moved by the crank *b*. The convex segment may be moved round by the hand without stopping the machine, so that all the glasses on its superficies will be equally polished.

The other spur-wheel C, by means of a crank in its shaft, gives motion to another frame *g*, employed in grinding the glass plates. The rod *h*, extended from the crank *f* to the frame *g*, is fastened to the latter by means of a pivot, in order to admit of a rotatory motion, as well as that given it by the crank in a longitudinal direction. This rotatory motion is effected by means of a rod of iron *i*, called a *trigger*, that at the extremity next the frame, where it touches the teeth of an horizontal spur-wheel, or circular piece of wood, fixed on the grinding-plate, while the other end is extended three feet two inches to the centre of motion.

But this contrivance, in which the merit of the machine principally consists, will be much better conceived from a small delineation of it by itself (fig. 6.), where *F* is the crank marked *f* in fig. 5. and turned by the spur-wheel C in the same figure. *G* is the trigger, three feet two inches long. *I*, a roll fixed on the trigger for the rod to slide on. *H*, the horizontal spur-wheel, eleven inches in diameter, fixed on the grinding-plate; the teeth of which is touched by the trigger; but with a very unequal force, as it will visibly depend upon the grinding-plate's being farther from, or nearer to, the centre of motion of the trigger. By this simple contrivance, the grinding plate has a very compound motion, never moving exactly in the same way, and therefore must grind the plates equally in every part. Several attempts have been made by others for producing the same effect: but without success; the grinding-plate always follows the same tract, and consequently the plates were ground unequally.

BURROW (See James), master of the crown office, was created B. R. S. and E. A. S. 1751. On the death of Mr West in 1772, he was proposed on to fill the president's chair at the royal society at the anniversary election, when he resigned it to Sir John Pringle; and August 18. 1773, when the society presented an address to his majesty, he received the honour of knighthood. He published two volumes of Reports in 1766; two others in 1771 and 1773; and a volume of Decisions of the Court of King's Bench upon settlement cases from 1752 to 1772 (to which was subjoined An Essay of Punishment), in three parts, 4to, 1768, 1772, 1773. The essay was also printed separately in 4to, 1773. He published, without his name, "A few Anecdotes and Observations relating to Oliver Cromwell and his family, tending to rectify several errors concerning him," published by Nicol. Conn. Papadopolis, in his *Hydria Gymnasia Patavinis*, 1763, 4to. He died in 1782.

BURROW
||
Burse.
v

BURROWS, holes in a warren, serving as a covert for rabbits, &c. A coney's coming out of her burrow is called *bolting*. To catch coney, they sometimes lay purse-nets over the burrows, then put in a terrier close muzzled, which making the creature bolt, she is caught in the net.

BURROWSTOUNNESS, or BORROWSTOUNNESS, a sea-port town of West Lothian, situated on the Forth, 18 miles west from Edinburgh. It is a small town, and continually enveloped in smoke from the numerous salt-works and coaleries that are near it; but is a place of considerable trade, and has a very commodious harbour. The town-house is built in form of a castle, and stands behind a great reservoir used for cleansing the harbour when it is much choaked with mud and sand.—Next to Leith, Borrowstounness was the principal trading town on the Forth before the canal was finished between it and the Clyde; and it is still much frequented by shipping: its exports in salt and coals are very great, and it has also several vessels employed in the Greenland fishery.

BURSA, or PRUSA, in geography, the capital of Bithinia in Asia Minor, situated in a fine fruitful plain, at the foot of mount Olympus, about 100 miles south of Constantinople. E. Long. 29. 0. N. Lat. 40. 30.

Bursa Pastoris, in botany. See THLASPI.

BURSA, *Burse*, originally signifies a purse. In middle-age writers it is more particularly used for a little college or hall in an university, for the residence of students, called *burfals* or *burfarii*. In the French universities it still denotes a foundation for the maintenance of poor scholars in their studies. The nomination to burfes is in the hands of the patrons and founders thereof. The burfes of colleges are not benefices, but mere places assigned to certain countries and persons. A burse becomes vacant by the burfar's being promoted to a cure.

BURSÆ MUCOSÆ. See ANATOMY, n° 8.

BURSA, or BURSE, (*Bursarius*), is used in middle age writers for a treasurer or cash-keeper. In this sense we meet with burfars of colleges. Conventual burfars were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas. The word is formed from the Latin *burfa*, whence also the English word *purse*; hence also the officer, who in a college is called *burfar*, in a ship is called *purfer*.

BURFARS, or *Burfors*, (*Bursarii*), also denote those to whom stipends are paid out of a burse or fund appointed for that purpose.

BURSARIA, the burfary, or exchequer of collegiate and conventual bodies; or the place of receiving, paying, and accounting by the burfarii or burfers.

BURSE, in matters of commerce, denotes a public edifice in certain cities, for the meeting of merchants to negotiate bills, and confer on other matters relating to money and trade. In this sense, burse amounts to the same with what we otherwise call an *exchange*.

The first place of this kind to which the name *Burse* was given, Guiechardin assures us was at Bruges; and it took its denomination from an hotel adjoining to it, built by a lord of the family de la Bourse, whose arms, which are three purses, are still found on the crowning over the portal of the house. Cattel's account is somewhat different, viz. that the merchants of Bruges

bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Bergen in Norway, and London. This last, anciently known by the name of the *common burse of merchants*, had the denomination since given it by queen Elizabeth, of the *royal exchange*. The most considerable burse is that of Amsterdam, which is a large building 240 feet long and 130 broad, round which runs a peristyle 20 feet wide. The columns of the peristyle, which are 46, are numbered, for the convenience of finding people. It will hold 4500 persons.

In the times of the Romans there were public places for the meeting of merchants in most of the trading cities of the empire; that built at Rome, in the 259th year after its foundation, under the consulate of Appius Claudius and Publius Servilius, was denominated the *college of merchants*; some remains of it are still to be seen, and are known by the modern Romans under the name *loggia*. The Hans towns, after the example of the Romans, gave the name of *colleges* to their burfes.

BURSERA, in botany; a genus of the monogymnia order, belonging to the hexandria class of plants. The calyx is triphylous; the corolla tripetalous; the capsule carnos. trivalved, and monospermous. There is but one species, the *gumifera*, or *gum elemi*. This is frequent in woods in most of the Bahama islands, and grows speedily to a great height and thickness. The bark is brown, and very like the birch of Britain. The wood is soft and useless, except when pieces of the barks are put into the ground as fences, when it grows readily, and becomes a durable barrier. The leaves are pinnate, the middle rib five or six inches long, with the pinnae set opposite to one another on footstalks half an inch long. It has yellow flowers, male and female on different trees. These are succeeded by purple-coloured berries bigger than large peas, hanging in clusters on a stalk of about five inches long, to which each berry is joined by a footstalk of half an inch long. The seed is hard, white, and of a triangular figure, inclosed within a thin capsule, which divides in three parts, and discharges the seed. The fruit, when cut, discharges a clear balsam or turpentine, esteemed a good vulnerary, particularly for horses. On wounding the bark, a thick milky liquor is obtained, which soon concretes into a resin no way different from the *gum elemi* of the shops (see *AMYRIS*). Dr Browne, and after him Linnaeus, have, according to Dr Wright, mistaken the bark of the roots for the simarouba, which is a species of *QUASSIA*.

BURTON upon TRENT, a town of Staffordshire, in England. It had formerly a large abbey; and over the river Trent it has now a famous bridge of free stone, about a quarter of a mile in length, supported by 37 arches. It consists chiefly of one long street, which runs from the place where the abbey stood to the bridge; and has a good market for corn and provisions. Burton ale is reckoned the best of any brought to London. E. Long. 1. 36. N. Lat. 52. 48.

BURTON, a town of Lincolnshire in England, seated on a hill near the river Trent. It is but a small place, and situated in W. Long. 0. 30. N. Lat. 53. 40.

BURTON, a town of Westmoreland in England, seated

Burfer
||
Burt.n.

Plate CX.

Burton. ed in a valley near a large hill called *Farleton-knot-hill*. It is pretty well built, and lies on the great road from Lancaster to Carlisle. W. Long. 2. 35. N. Lat. 54. 10.

BURTON (Robert), known to the learned by the name of *Democritus junior*, was younger brother to William Burton who wrote "The antiquities of Leicestershire;" and born of an ancient family at Lindley, in that county, upon the 8th of February 1576. He was educated in grammatical learning in the free school of Sutton Colfield in Warwickshire; in the year 1593 was sent to Brazen-nose college in Oxford; and in 1599 was elected student of Christ-church. In 1616, he had the vicarage of St Thomas, in the west suburb of Oxford, conferred upon him by the dean and canons of Christ-church, to the parishioners of which, it is said, that he always gave the sacrament in wafers; and this, with the rectory of Segrave in Leicestershire, given him some time after by George lord Berkeley, he held to the day of his death, which happened in January 1639.

He was a man of general learning; a great philosopher; an exact mathematician; and (what makes the peculiarity of his character) a very curious calculator of nativities. He was extremely studious, and of a melancholy turn; yet an agreeable companion, and very humorous. *Treatise of melancholy*, by *Democritus junior*, as he calls himself, shows, that these different qualities were mixed together in his composition. This book was printed first in 4to, afterwards in folio, in 1624, 1632, 1638, and 1652, to the great emolument of the bookseller, who, as Mr Wood tells us, got an estate by it. Some circumstances attending his death occasioned strange suspitions. He died in his chamber at or very near the time which, it seems, he had some years before predicted from the calculation of his nativity; and this exactness made it whispered about, that for the glory of astrology, and rather than his calculation should fail, he became indeed a *sele de se*. This, however, was generally discredited; he was buried with due solemnity in the cathedral of Christ-church, and had a fair monument erected to his memory. He left behind him a very choice collection of books. He bequeathed many to the Bodleian library; and 100*l.* to Christ-church, the interest of which was to be laid out yearly in books for their library.

BURTOS (John), D. D. a late worthy and learned divine, was born in 1696, at Wembworth, in Devonshire, his father being rector of that parish; and was educated at Corpus Christi college, Oxford. In 1725, being then pro-rector and master of the schools, he spoke a Latin oration before the determining bachelor, which is entitled "*Hei!* or, An instance of a magistrate's erring through unseasonable lenity;" written and published with a view to encourage the salutary exercise of academical discipline; and afterwards treated the same subject still more fully in four Latin sermons before the university, and published them with appendices. He also introduced into the schools, Locke, and other eminent modern philosophers, as suitable companions to Aristotle; and printed a double series of philosophical questions, for the use of the younger students; from which Mr Johnson of Magdalene college, Cambridge, took the hint of his larger work of the same kind, which has gone through several editions.

When the settling of Georgia was in agitation, Dr Bray, justly revered for his institution of parochial libraries, Dr Stephen Hale, Dr Brinman, and other learned divines, intreated Mr Burton's pious assistance in that undertaking. This he readily gave, by preaching before the society in 1732, and publishing his sermon, with an appendix on the state of that colony; and he afterwards published an account of the design of the associates of the late Dr Bray, with an account of their proceedings.

About the same time, on the death of Dr Edward Littleton, he was presented by Eton college to the vicarage of Maple-Derham, in Oxfordshire. Here a melancholy scene, which too often appears in the mansions of the clergy, presented itself to his view; a widow, with three infant daughters, without a home, without a fortune: from his compassion arose love, the consequence of which was marriage; for Mrs Littleton was handsome, elegant, accomplished, ingenious, and had great sweetness of temper. In 1760, he exchanged his vicarage of Maple-Derham, for the rectory of Worplesdon in Surrey. In his advanced age, finding his eyes begin to fail him, he collected and published, in one volume, all his scattered pieces, under the title of *Opera miscellanea*; and soon after died, February 11th, 1771.

BURON, in the sea-language, a small tackle consisting of two single blocks, and may be made fast anywhere at pleasure, for hoisting small things in and out.

BURY, is sometimes used to denote the hole or den of some animal under ground. In this sense we say the *bury* of a mole, a tortoise, or the like. The grillo-talpa, or mole-cricket, digs itself a bury with its fore-feet, which are made broad and strong for that purpose. Naturalists speak of a kind of urethras in the island of Maraguan, which have two entries to their buries, one towards the north, the other to the south, which they open and shut alternately as the wind happens to lie.

BURY, in geography, a market town of Lancashire, about 30 miles south-east of Lancaster. It is a burony in the family of Albemarle. W. Long. 2. 20. N. Lat. 53. 36.

BURY (St Edmund's), or *St Edmund's bur*, the county town of Suffolk, about 12 miles east of Newmarket, and 70 north-east of London. E. Long. 2. 45. N. Lat. 52. 20.

BURYING, the same with interment or BURIAL.

BURYING ALIVE was the punishment of a virgin who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on. But this was only for show; for the moment she was let down, they began to cast in the earth upon her till the pit was filled up. Some middle-age writers seem to make *Burying alive* (*Actus*) the punishment of a woman thief. Lord Bacon gives instances of the return of a of persons who have been buried alive. The famous Duns Scotus is of the number; who, having been seized with a catalepsy, was thought dead, and laid to sleep among his father's, but raised again by his father, in whose absence he had been buried. Bartholin gives an account of a woman, who, on recovering from an apoplexy, could not be convinced but that she was dead, and solicited so long and so earnestly to be buried.

Burying
||
Butby.

ried, that they were forced to comply: and performed the ceremonies, at least in appearance. The famous emperor Charles V. after his abdication, took it into his head to have his burial celebrated in his lifetime, and assisted at it. See CHARLES V.

BURYING-Place. The ancients buried out of cities and towns; an usage which we find equally among Jews, Greeks, and Romans. Among the last, burying within the walls was expressly prohibited by a law of the 12 tables. The usual places of interment were in the suburbs and fields, but especially by the waysides. We have instances, however, of persons buried in the city; but it was a favour allowed only to a few of singular merit in the commonwealth. Plutarch says, those who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are said to have had tombs in the forum; and Cicero adds Tubertus to the number. Lycurgus allowed his Lacedaemonians to bury their dead within the city and around their temples, that the youth, being inured to such spectacles, might be the less terrified with the apprehension of death. Two reasons are alleged why the ancients buried out of cities: the first, an opinion, that the sight, touch, or even neighbourhood, of a corpse defiled a man, especially a priest; whence that rule in A. Gellius, that the *flamen Dialis* might not on any account enter a place where there was a grave: the second, to prevent the air from being corrupted by the stench of putrefied bodies, and the buildings from being endangered by the frequency of funeral fires.

Burying in churches was not allowed for the first 200 years after Christ; and the same was severely prohibited by the Christian emperors for many ages afterwards. The first step towards it appears to have been the practice of erecting churches over the graves of some martyrs in the country, and translating the relics of others into churches in the city: the next was, allowing kings and emperors to be buried in the atrium or church-porch. In the 6th century, the people began to be admitted into the church-yards; and some princes, founders, and bishops, into the church. From that time the matter seems to have been left to the discretion of the bishop.

BUSBEC (Auger Gillen, lord of), a person illustrious on account of his embassies, was born at Commines, in the year 1522; and educated at the most famous universities, at Louvain, at Paris, at Venice, at Bologna, and at Padua. He was engaged in several important employments and negotiations, and particularly was twice sent ambassador by the king of the Romans to the emperor Soliman. He collected inscriptions; bought manuscripts; searched after rare plants; enquired into the nature of animals; and, in his second journey to Constantinople, carried with him a painter, that he might be able to communicate to the curious, the figures, at least, of the plants and animals that were not well known in the west. He wrote a Discourse of the state of the Ottoman empire, and a Relation of his two journeys to Turkey, which are much esteemed. He died in 1592.

BUSBY (Dr Richard), son of a gentleman in Westminster, was born at Lutton in Lincolnshire, in 1606. He passed through the classes in Westminster school, as king's scholar; and completed his studies at

Christ-church, Oxford. In 1640, he was appointed master of Westminster school; and by his skill and diligence in the discharge of this important and laborious office, for the space of 55 years, bred up the greatest number of eminent men in church and state that ever at one time adorned any age or nation. He was extremely severe in his school; though he applauded wit in his scholars, even when it reflected on himself. This great man, after a long and healthy life purchased by temperance, died in 1695, aged 89; and was buried in Westminster abbey, where there is a fine monument erected for him, with a Latin inscription. He composed several books for the use of his school.

BUSH (Paul), the first bishop of Bristol, became a student in the university of Oxford about the year 1513, and in 1518 took the degree of bachelor of arts. He afterwards became a brother of the order called *bonhomis*; of which, after studying some time among the friars of St Austin (now Wadham college), he was elected provincial. In that station he lived many years; till at length king Henry VIII. being informed of his great knowledge in divinity and physic, made him his chaplain, and in 1542 appointed him to the new episcopal see of Bristol: but having in the reign of Edward VI. taken a wife, he was, on the accession of Mary, deprived of his dignity, and spent the remainder of his life in a private station at Bristol, where he died in the year 1558, aged 68, and was buried on the north side of the choir of the cathedral. Wood says, that while he was a student at Oxford, he was numbered among the celebrated poets of that university; and Pits gives him the character of a faithful catholic, his want of charity notwithstanding. He wrote, 1. An exhortation to Margaret Burges, wife to John Burges, clothier, of King's-wood, in the county of Wilts. Lond. printed in the reign of Edward VI. 8vo. 2. Notes on the Psalms. 3. Treatise in praise of the cross. 4. Answer to certain queries concerning the abuses of the mass. Records, No. 25. 5. Dialogue between Christ and the Virgin Mary. 6. Treatise of salves and curing remedies. 7. A little treatise in English, called *The extirpation of ignorancy*, &c. in verse, Lond. by Pinson, 4to. 8. *Carmina diversa*.

BUSH, a term used for several shrubs of the same kind growing close together: thus we say, a *furze-bush*, *bramble-bush*, &c.

BUSH is sometimes used, in a more general sense, for any assemblage of thick branches interwoven and mixed together.

BUSH also denotes a coronated frame of wood hung out as a sign at taverns. It takes the denomination from hence, that, anciently, signs where wine was sold were *bushes* chiefly of ivy, cypress, or the like plant, which keeps its verdure long. And hence the English proverb, "Good wine needs no *bush*."

Burning-BUSH, that bush wherein the Lord appeared to Moses at the foot of mount Horeb, as he was feeding his father-in-law's flocks.

As to the person that appeared in the bush, the text says, "That the angel of the Lord appeared unto him in a flame of fire, out of the middle of the bush;" but whether it was a created angel, speaking in the person of God, or God himself, or (as the most received opinion is) Christ the son of God, has been matter of

Butchers

ferta; so called from Bus, or Buz, Nahor's second son; the country of Elihu, the fourth interlocutor in Job; called *Buzites*, by the Septuagint.

BUSKIN, a kind of shoe, somewhat in manner of a boot, and adapted to either foot, and worn by either sex. This part of dress, covering both the foot and mid-leg, was tied underneath the knee; it was very rich and fine, and principally used on the stage by actors in tragedy. It was of a quadrangular form; and the sole was so thick, as that, by means thereof, men of the ordinary stature might be raised to the pitch and elevation of the heroes they personated. The colour was generally purple on the stage; herein it was distinguished from the sock worn in comedy, that being only a low common shoe. The buskin seems to have been worn not only by actors but by girls, to raise their height; travellers and hunters also made use of it, to defend themselves from the mire. In classic authors, we frequently find the buskin used to signify tragedy itself, in regard it was a mark of tragedy on the stage. It was also to be understood for a lofty strain or high style.

BUSS, in maritime affairs, a small sea-vessel, used by us and the Dutch in the herring fishery, commonly from 48 to 60 tons burden, and sometimes more: a buss has two small sheds or cabins, one at the prow and the other at the stern; that at the prow serves for a kitchen. Every buss has a master, an assistant, a mate, and seamen in proportion to the vessel's bigness; the master commands in chief, and without his express orders the nets cannot be cast nor taken up; the assistant has the command after him; and the mate next, whose business is to see the seamen manage their rigging in a proper manner, to mind those who draw in their nets, and those who kill, gut, and cure the herrings, as they are taken out of the sea: the seamen do generally engage for a whole voyage in the lump. The provision which they take on board the busses, consist commonly in biscuit, oat-meal, and dried or salt fish; the crew being content for the rest with what fresh fish they catch. See **FISHERIES**.

BUST, or **BUSTO**, in Sculpture, denotes the figure or portrait of a person in relievo, showing only the head, shoulders, and stomach, the arms being lopped off; ordinarily placed on a pedestal, or console.

In speaking of an antique, we say the head is marble, and the bust porphyry, or bronze, that is, the stomach and shoulders. Felibien observes, that though in painting, one may say a figure appears in busto, yet it is not properly called a *bust*, that word being confined to things in relievo.

The bust is the same with what the Latins called *Hermæ*, from the Greek Hermes, Mercury, the image of that god being frequently represented in this manner among the Athenians.

BUST is also used, especially by the Italians, for the trunk of an human body, from the neck to the hips.

BUSTA Gallica, was a place in ancient Rome, wherein the bones of the Gauls, who first took the city, and were slain by Camillus, were deposited. It differed from

BUSTA Gallorum, a place on the Apennines, thus called by reason of many thousand of Gauls killed there by Fabius.

BUSTARD, in ornithology. See **OTIS**.

BUSTUARIE ΜΟΕΧΑΕ, according to some, women that were hired to accompany the funeral and lament the loss of the deceased; but others are of opinion, that they were rather the more common prostitutes, that stood among the tombs, graves, and other such lonely places.

BUSTUARI, in Roman antiquity, gladiators who fought about the bustum or funeral pile of a person of distinction, that the blood which was spilt might serve as a sacrifice to the infernal gods, and render them more propitious to the manes of the deceased. This custom was introduced in the room of the more inhuman one of sacrificing captives at the bustum, or on the tombs of warriors.

BUSTUM, in antiquity, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceased, in order to be burnt.

The Romans borrowed the custom of burning their dead from the Greeks. The deceased, crowned with flowers, and dressed in his richest habits, was laid on the bustum. Some authors say, it was only called *bustum*, after the burning, *quasi beneustum*: before the burning it was more properly called *pyra*; during it, *ragus*; and afterwards, *bustum*. When the body was only burnt there, and buried elsewhere, the place was not properly called *bustum*, but *ustrina*, or *ustrinum*.

BUSTUM, in the Campus Martius, was a structure whereon the emperor Augustus first, and after him, the bodies of his successors were burnt. It was built of white stone, surrounded with an iron palisade, and planted within with alder trees.

BUSTUM was also figuratively applied to denote any tomb. Whence those phrases, *facere bustum*, *violare bustum*, &c.

Bustum of an altar, was the hearth or place where the fire was kindled.

BUTCHER, a person who slaughters cattle for the use of the table, or who cuts up and retails the same.

Among the ancient Romans, there were three kinds of established butchers, whose office it was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. The *suarii* provided hogs; the *pecuarii* or *boarii*, other cattle, especially oxen; and under these was a subordinate class, whose office was to kill, called *lanii*, and *carnifices*.

To exercise the office of butcher among the Jews with dexterity, was of more reputation than to understand the liberal arts and sciences. They have a book concerning shamble-constitution; and in case of any difficulty, they apply to some learned rabbi for advice: nor was any allowed to practise this art, without a licence in form; which gave the man, upon evidence of his abilities, a power to kill meat, and others to eat what he killed; provided he carefully read every week for one year, and every month the next year, and once a quarter during his life, the constitution abovementioned.

We have some very good laws for the better regulation and preventing the abuses committed by butchers. A butcher that sells swine's flesh mangled, or dead of the murrain, for the first offence shall be amerced; for the second, have the pillory; for the third, be imprisoned, and make fine; and for the fourth, abjure the town. Butchers not selling meat at reasonable prices,

Butcher

Butler.

small forfeit double the value, leviable by warrant of two justices of the peace. No butcher shall kill any flesh in his scalding-house, or within the walls of London, on pain to forfeit for every ox so killed, 12 d. and for every other beast, 8d. to be divided betwixt the king and the prosecutor.

BUTCHER-BIRD, in ornithology. See *LANIUS*.

BUTCHER-BROOM, in botany. See *RUSCUS*.

BUTCHER'S ISLAND, in the East Indies, a small island about two miles long and scarce one broad. It has its name from cattle being kept there for the use of Bombay, from which it is about three miles distant. It has a small fort, but of very little consequence.

BUTE, an island lying to the west of Scotland, being separated from Cowal, a district of Argyshire, only by a narrow channel. In length it is about 18 miles; the broadest part from east to west is about five. Part of it is rocky and barren; but from the middle southwards, the ground is cultivated, and produces pease, oats, and barley. Here is a quarry of red stone, which the natives have used in building a fort and chapel in the neighbourhood of Rothsay, which is a very ancient royal borough, head town of the shire of Bute and Arran; but very thinly peopled, and maintained chiefly by the herring fishery, with the profits of which all the rents of this island are chiefly paid. On the north side of Rothsay are the ruins of an ancient fort, with its draw-bridge, chapel, and barracks. Here are likewise the remains of some Danish towers. The natives are healthy and industrious, speak the Erse and the dialect of the Lowlands indifferently, and profess the Protestant religion. The island is divided into two parishes, accommodated with four churches; and belongs chiefly to the earl of Bute, who possesses an elegant seat near Rothsay. This island, with that of Arran, the greater and lesser Cumbrae, and *Inch-marnoc*, form a county under the name of *Bute*. This shire and that of Caithness send a member to parliament alternately. The earl of Bute is admiral of the county, by commission from his majesty; but no way dependent on the lord high admiral of Scotland: so that if any maritime case occurs within this jurisdiction, (even crimes of as high a nature as murder or piracy), his lordship, by virtue of the powers as admiral, is sufficient judge, or he may delegate his authority to any deputies. The name of this isle has by several authors, and in different periods, been very differently written, as *Bute*, *Both*, *Bothe*, *Bot*, but now generally *Bute*. Our ancient writers suppose that it derived its name from a cell erected therein by St Brendan, an Irish abbot who flourished in the 6th century, because in his language such a cell was called *Both*. It is, however, probable, that this name was of greater antiquity, since we find it denominated *Botis* by the anonymous geographer of Ravenna. It was from very early times part of the patrimony of the Stuarts: large possessions in it were granted to Sir John Stuart, son of Robert II. by his beloved mistress Elizabeth More; and it has continued in that line to the present time.

BUTEO, in ornithology, the trivial name of a species of *FALCO*.

BUTLER (Charles), a native of Wycomb in the county of Bucks, and a master of arts in Magdalen college, Oxford, published a book with this title, "The principles of music in singing and setting; with the

two-fold use thereof, ecclesiastical and civil." Quarto, London 1636. The author of this book was a person of singular learning and ingenuity, which he manifested in sundry other works enumerated by Wood in the *Athen. Oxon.* Among the rest is an English grammar, published in 1633, in which he proposes a scheme of regular orthography, and makes use of characters, some borrowed from the Saxon, and others of his own invention, so singular, that we want types to exhibit them: and of this imagined improvement he appears to have been so fond, that all his tracts are printed in like manner with his grammar; the consequence whereof has been an almost general disgust to all that he has written. His "Principles of music" is, however, a very learned, curious, and entertaining book; and, by the help of the advertisement from the printer to the reader, prefixed to it, explaining the powers of the several characters made use of by him, may be read to great advantage, and may be considered as a judicious supplement to Morley's introduction.

BUTLER (Samuel), a celebrated poet of the last century, was the son of a reputable Worcestershire farmer, and born in 1612. He passed some time at Cambridge, but was never matriculated in that university. Returning to his native country, he lived some years as clerk to a justice of peace; where he found sufficient time to apply himself to history, poetry, and painting. Being recommended to Elizabeth countess of Kent, he enjoyed in her house, not only the use of all kinds of books, but the conversation of the great Mr Selden, who often employed Butler to write letters, and translate for him. He lived also some time with Sir Samuel Luke, a gentleman of an ancient family in Bedfordshire, and a famous commander under Oliver Cromwell: and he is supposed at this time to have wrote, or at least to have planned, his celebrated *Hudibras*; and under that character to have ridiculed the knight. The poem itself furnishes this key; where, in the first canto, Hudibras says,

" 'Tis sung, there is a valiant mamaluke
" In foreign land yclep'd — — —
" To whom we oft have been compar'd
" For person, parts, address, and beard."

After the restoration, Mr Butler was made secretary to the earl of Carbury, lord-president of Wales, who appointed him steward of Ludlow castle, when that court was revived there. No one was a more generous friend to him than the earl of Dorset and Middlesex, to whom it was owing that the court tasted his *Hudibras*. He had promises of a good place from the earl of Clarendon, but they were never accomplished; though the king was so much pleas'd with the poem, as often to quote it pleasantly in conversation. It is indeed said, that Charles ordered him the sum of 3000 l: but the sum being expressed in figures, somebody through whose hands the order pass'd, by cutting on a cypher, reduced it to 300 l. which, though it pass'd the offices without fee, prov'd not sufficient to pay what he then owed; so that Butler was not a billing the better for the king's bounty. He died in 1680: and though he met with many disappointments, was never reduced to any thing like want, nor did he die in debt. Mr Granger observes, that Butler stands without rival in burlesque poetry. His *Hudibras* (says

Butler.
Butlerage.Butment
||
Butter.

he) is, in its kind, almost as great an effort of genius, as the Paradise Lost itself. It abounds with uncommon learning, new rhimes, and original thoughts. Its images are truly and naturally ridiculous. There are many strokes of temporary satire, and some characters and allusions which cannot be discovered at this distance of time."

BUTLER (Joseph), late bishop of Durham, a prelate distinguished by his piety and learning, was the youngest son of Mr Thomas Butler, a reputable shop-keeper at Wantage, in Berkshire, where he was born in the year 1692. His father, who was a presbyterian, observing that he had a strong inclination to learning, after his being at a grammar-school, sent him to an academy in Gloucestershire, in order to qualify him for a dissenting minister; and while there, he wrote some remarks on Dr Clerk's first sermon at Boyle's lecture. Afterwards, resolving to conform to the established church, he studied at Oriel college, where he contracted an intimate friendship with Mr Edward Talbot, son of the bishop of Durham, and brother to the lord chancellor, who laid the foundation of his subsequent advancement. He was first appointed preacher at the Rolls, and rector of Houghton and Stanhope, two rich benefices in the bishopric of Durham. He quitted the Rolls in 1726; and published in 8vo a volume of sermons, preached at that chapel. After this he constantly resided at Stanhope, in the regular discharge of all the duties of his office, till the year 1733, when he was called to attend the lord chancellor Talbot as his chaplain, who gave him a prebend in the church of Rochester. In the year 1736, he was appointed clerk of the closet to queen Caroline, whom he attended every day, by her majesty's special command, from seven to nine in the evening. In 1738 he was appointed to the bishopric of Bristol; and not long afterwards to the deanery of St Paul's, London. He now resigned his living of Stanhope. In the year 1746, he was made clerk of the closet to the king; and in 1750, was translated to Durham. This rich preferment he enjoyed but a short time; for he died at Bath June 16th, 1752. His corpse was interred in the cathedral at Bristol; where there is a monument, with an inscription, erected to his memory. He died a bachelor. His deep learning and comprehensive mind appear sufficiently in his writings, particularly in that excellent treatise intitled, *The Analogy of religion, natural and revealed, to the constitution and course of nature*, published in 8vo, 1736.

BUTLER, the name anciently given to an officer in the court of France, being the same as the grand echançon, or great cup-bearer of the present times.

BUTLER, in the common acceptation of the word, is an officer in the houses of princes and great men, whose principal business is to look after the wine, plate, &c.

BUTLERAGE of wine, is a duty of 2 s. for every ton of wine imported by merchants strangers; being a composition in lieu of the liberties and freedoms granted to them by king John and Edward I. by a charter called *charta mercatoria*.

Butlerage was originally the only custom that was payable upon the importation of wines, and was taken and received by virtue of the regal prerogative, for the proper use of the crown. But for many years past,

there having been granted by parliament subsidies to the kings of England, and the duty of butlerage not repealed, but confirmed, they have been pleased to grant the same away to some nobleman, who, by virtue of such grant, is to enjoy the full benefit and advantage thereof, and may cause the same to be collected in the same manner that the kings themselves were formerly wont to do.

BUTMENT. Butments of arches are the same with buttresses. They answer to what the Romans call *sublicas*, the French *culées* and *butees*.

BUTMENTS, or *Abutments*, of a bridge, denote the two massives at the end of a bridge, whereby the two extreme arches are sustained and joined with the shore on either side.

BUTOMUS, the **FLOWERING-RUSH**, or *Water-gladiolus*: A genus of the hexagynia order, belonging to the canceandria class of plants. There is no calyx, but it has six petals, and as many monospermous capsules. There is but one species, viz. the *umbellatus*; of which there are two varieties, the one with a white, the other with a rose-coloured, flower. Though common plants, they are very pretty, and are worth propagating in a garden where there is conveniency for an artificial bog, or where there are ponds of standing water, as is many times the case. Where these conveniences are wanting, they may be planted in cisterns, which should be kept filled with water, with about a foot thickness of earth in the bottom; and into this earth the roots should be planted, or the seeds sown as soon as they are ripe.

BUTRINTO, a port-town of Epirus, or Canina, in Turkey in Europe, situated opposite to the island of Corfu, at the entrance of the gulph of Venice. E. Long. 20. 40. N. Lat. 39. 45.

BUTT is used for a vessel, or measure of wine, containing two hogheads, or 126 gallons; otherwise called *pipe*. A butt of currans is from 15 to 2,200 weight.

БУТТ, or *Butt-ends*, in the sea-language, are the fore-ends of all planks under water, as they rise, and are joined one end to another.—Butt-ends in great ships are most carefully bolted; for if any one of them should spring or give way, the leak would be very dangerous and difficult to stop.

BUTTS, the place where archers meet with their bows and arrows to shoot at a mark, which we call shooting at the *butts*: (See **ARCHERY**.)—Also *butts* are the short pieces of land in arable ridges and furrows.

BUTTER, a fat unctuous substance, prepared from milk by heating or churning.

It was late ere the Greeks appear to have had any notion of butter; their poets make no mention of it, and yet are frequently speaking of milk and cheese.

The Romans used butter no otherwise than as a medicine, never as a food.

The ancient Christians of Egypt burnt butter in their lamps instead of oil; and in the Roman churches, it was anciently allowed, during Christmas time, to burn butter instead of oil, on account of the great consumption of it otherwise.

Butter is the fat, oily, and inflammable part of the milk. This kind of oil is naturally distributed through all the substance of the milk in very small particles, which are interposed betwixt the caseous and serous parts, amongst which it is suspended by a slight adhesion, but without being dissolved. It is in the same state

Butter. in which oil is in emulsions: hence the same whiteness of milk and emulsions; and hence, by rest, the oily parts separate from both these liquors to the surface, and form a cream. See EMULSION.

When butter is in the state of cream, its proper oily parts are not yet sufficiently united together to form an homogeneous mass. They are still half separated by the interposition of a pretty large quantity of ferrous and caseous particles. The butter is completely formed by pressing out these heterogeneous parts by means of continued percussion. It then becomes an uniform soft mass.

Fresh butter which has undergone no change, has scarcely any smell; its taste is mild and agreeable, it melts with a weak heat, and none of its principles are disengaged by the heat of boiling water. These properties prove, that the oily part of butter is of the nature of the fat, fixed, and mild oils obtained from many vegetable substances by expression. See OILS.—The half fluid consistence of butter, as of most other concrete oily matters, is thought to be owing to a considerable quantity of acid united with the oily part; which acid is so well combined, that it is not perceptible while the butter is fresh and has undergone no change; but when it grows old, and undergoes some kind of fermentation, then the acid is disengaged more and more; and this is the cause that butter, like oils of the same kind, becomes rancid by age.

Butter is constantly used in food, from its agreeable taste: but to be wholesome, it must be very fresh and free from rancidity, and also not fried or burnt; otherwise its acrid and even caustic acid, being disengaged, disorders digestion, renders it difficult and painful, excites acrid empyreumatic belchings, and introduces much acrimony into the blood. Some persons have stomachs so delicate, that they are even affected with these inconveniences by fresh butter and milk. This observation is also applicable to oil, fat, chocolate, and in general to all oleaginous matters.

For the making of butter: When it has been churned, open the churn, and with both hands gather it well together, take it out of the butter-milk, and lay it into a very clean bowl, or earthen pan; and if the butter be designed to be used sweet, fill the pan with clear water, and work the butter in it to and fro, till it is brought to a firm consistence of itself, without any moisture. When this has been done, it must be scotched and sliced over with the point of a knife, every way as thick as possible, in order to fetch out the smallest hair, mote, bit of rag, strainer, or any thing that may have happened to fall into it. Then spread it thin in a bowl, and work it well together, with such a quantity of salt, as you think fit, and make it up into dishes, pounds, half pounds, &c.

In the Geographical Essays, Vol. V. p. 209. we have the following method of making well-tasted butter from the milk of cows fed on turnips. "Let the bowls, either lead or wood, be kept constantly clean, and well scalded with boiling water before using. When the milk is brought into the dairy, to every eight quarts mix one quart of boiling water; then put up the milk into the bowls to stand for cream."

The trade in butter is very considerable. Some compute 50,000 tons annually consumed in London. It is chiefly made within 40 miles round the city. Fifty

thousand firkins are said to be sent yearly from Cambridge and Suffolk alone; each firkin containing 56 lbs. Uttoxeter in Staffordshire is a market famous for good butter, inasmuch that the London merchants have established a factory there for that article. It is bought by the pot, of a long cylindrical form, weighing 14 lb.

But no butter is esteemed equal to that which is made in the county of Essex, well known by the name of Lipping butter, and which in almost every season of the year yields at London from one stilling to 14 pence per pound avertupoise. The following directions concerning the making and management of butter, including the Lipping method, are extracted from the 3d volume of the Bath Society Papers.

In general it is to be observed, that the greater the quantity made from a few cows, the greater will be the farmer's profit; therefore he should never keep any but what are esteemed good milkers. A bad cow will be equally expensive in her keep, and will not perhaps (by the butter and cheese that is made from her) bring in more than from three to six pounds a-year; where is a good one will bring from seven to ten pounds per annum: therefore it is obvious that bad cows should be parted with, and good ones purchased in their room. When such are obtained, a good servant should be employed to milk them; as through the neglect and mismanagement of servants, it frequently happens that the best cows are spoiled. No farmer should trust entirely to servants, but sometimes to see themselves that their cows are milked clean: for if any milk is suffered to remain in the udder, the cow will daily give less, till at length she will become dry before the proper time, and the next season she will scarce give milk sufficient to pay for her keep.

It sometimes happens that some of a cow's teats may be scratched or wounded so as to produce foul or corrupted milk: when this is the case, we should by no means mix it with the sweet milk, but give it to the pigs; and that which is conveyed to the dairy-house should remain in the pail till it is nearly cool, before it be strained, that is, if the weather be warm; but in froily weather it should be first exactly strained, and a small quantity of boiling water may be mixed with it, which will cause it to produce cream in abundance, and the more so if the pans or vats have a large surface.

During the hot summer-months, it is right to stir with or before the sun, that the cream may be skimmed from the milk ere the dairy becomes warm; nor should the milk at that season stand longer in the vats, &c. than 24 hours, nor be returned in the evening till after sun-set. In winter milk may remain unskimmed for 36 or 48 hours; the cream should be deposited in a deep pan, which should be kept during the summer in the coolest part of the dairy; or in a cool cellar where a free air is admitted, which is still better. Where people have not an opportunity of churning every other day, they should stir the cream daily into clean pans, which will keep it cool, but they should never fail to churn at least twice in the week in hot weather; and this work should be done in a morning before the sun appears, taking care to fix the churn where there is a free draught of air. If a pump-churn be to be used, it may be plunged a foot deep into a tub of cold water, and should remain there during the

Butter. whole time of churning, which will very much harden the butter. A strong rancid flavour will be given to butter, if we churn so near the fire as to heat the wood in the winter season.

After the butter is churned, it should be immediately washed in many different waters till it is perfectly cleansed from the milk; but here it must be remarked, that a warm hand will soften it, and make it appear greasy, so that it will be impossible to obtain the best price for it. The cheesemongers use two pieces of wood for their butter; and if those who have a very hot hand were to have such, they might work the butter so as to make it more saleable.

The Epping butter is made up for market in long rolls, weighing a pound each; in the county of Somerset they dish it in half pounds for sale; but if they forget to rub salt round the inside of the dish, it will be difficult to work it so as to make it appear handsome.

Butter will require and endure more working in winter than in summer; but it is remarked, that no person whose hand is warm by nature makes good butter.

Those who use a pump-churn must endeavour to keep a regular stroke; nor should they admit any person to assist them, except they keep nearly the same stroke: for if they churn more slowly, the butter will in the winter go *ba. k.*, as it is called; and if the stroke be more quick and violent in the summer, it will cause a fermentation, by which means the butter will imbibes a very disagreeable flavour.

Where people keep many cows, a barrel-churn is to be preferred; but if this be not kept very clean, the bad effects will be discovered in the butter; nor must we forget to shift the situation of the churn when we use it, as the seasons alter, so as to fix it in a warm place in winter, and where there is a free air in summer.

In many parts of this kingdom they colour their butter in winter, but this adds nothing to its goodness; and it rarely happens that the farmers in or near Epping use any colour, but when they do, it is very innocent. They procure some sound carrots, whose juice they express through a sieve, and mix with the cream when it enters the churn, which makes it appear like May butter; nor do they at any time use much salt, though a little is absolutely necessary.

As they make in that country but very little cheese, so of course very little whey-butter is made: nor indeed should any person make it, except for present use, as it will not keep good more than two days; and the whey will turn to better account to fatten pigs with. Nothing feeds these faster, nor will any thing make them so delicately white. At the same time it is to be observed, that no good bacon can be made from pigs thus fattened; where much butter is made, good cheese for servants may be obtained from skimmed milk, and the whey will afterwards do for store pigs.

The foregoing rules will suffice for making good butter in any country; but as some people are partial to the west-country method, it shall be described as briefly as possible.

In the first place, they deposit their milk in earthen pans in their dairy-house, and (after they have stood twelve hours in the summer, and double that space in

the winter) they remove them to stoves made for that purpose, which stoves are filled with hot embers; on these they remain till bubbles rise, and the cream changes its colour, it is then deemed heated enough, and this they call scalded cream: it is afterwards removed steadily to the dairy, where it remains twelve hours more, and is then skimmed from the milk and put into a tub or churn: if it be put into a tub, it is beat well with the hand, and thus they obtain butter; but a cleaner way is to make use of a churn. Some scald it over the fire, but then the smoke is apt to affect it; and in either case, if the pans touch the fire, they will crack or fly, and the milk and cream will be wasted.

The Cambridgeshire salt butter is held in the highest esteem, and is made nearly after the same method as the Epping; and by washing and working the salt from it the cheesemongers in London often sell it at a high price for fresh butter. They deposit it when made into wooden tubs or firkins, which they expose to the air for two or three weeks, and often wash them; but a readier way is to season them with unslaked lime, or a large quantity of salt and water well boiled will do: with this they must be scrubbed several times, and afterwards thrown into cold water, where they should remain three or four days, or till they are wanted; then they should be scrubbed as before, and well rinsed with cold water; but before they receive the butter, care must be taken to rub every part of the firkin with salt; then if the butter be properly made, and perfectly sweet, it may be gently pressed into the firkin; but it must be well salted when it is made up, and the salt should be equally distributed through the whole mass, and a good handful of salt must be spread on the top of the firkin before it is headed, after which the head should be immediately put on.

They pursue nearly the same method in Suffolk and Yorkshire; nor is the butter that is made in these counties much inferior to that made in Cambridgeshire; indeed it is often sold in London for Cambridge butter; and no people make more butter from their cows than the Yorkshire farmers do, which is certainly owing to the care they take of their cows in the winter; as at that season they house them all, feed them with good hay, and never suffer them to go out (except to water) but when the weather is very serene; and when their cows calve, they give them comfortable malt mashes for two or three days after; but these cows never answer if they are removed to other counties, except the same care and attendance be given them, and then none answer better.

Land whereon cows feed does very often affect the butter. If wild garlic, charlock, or May-weed, be found in a pasture ground, cows should not feed therein till after they have been mown, when such pernicious plants will appear no more till the following spring; but those cows that give milk must not partake of the hay made therefrom, as that will also diffuse its bad qualities.

Great part of the Epping butter is made from cows that feed during the summer months in Epping forest, where the leaves and shrubby plants contribute greatly to the flavour of the butter. The mountains of Wales, the highlands of Scotland, and the moors, commons, and heaths in England, produce excellent butter where it is properly managed; and though not equal in quantity,

Butter,
butterfly.

quantity, yet far superior in quality to that which is produced from the richest meadows; and the land is often blasted when the butter is bad through mismanagement, stultifness, or inattention.

Turnips and rape affect milk and butter, but brewers grains are sweet and wholesome food, and will make cows give abundance of milk; yet the cream thereon will be thin, except good hay be given at the same time, after every meal of grains. Coleworts and cabbages are also excellent food; and if these and favours were cultivated for this purpose, the farmers in general would find their account in it.

Cows should never be suffered to drink improper water; stagnated pools, water wherein frogs, &c. spawn, common sewers, and ponds that receive the drainings of stables, are improper.

Divers abuses are committed in the packing and salting of butter, to increase its bulk and weight, against which we have a statute express. Pots are frequently laid with good butter for a little depth at the top, and with bad at the bottom; sometimes the butter is set in rolls, only touching at top, and standing hollow at bottom. To prevent these cheats, the factors at Utoxeter keep a surveyor, who, in case of suspicion, tries the pots with an iron instrument called a *butter-bore*, made like a cheese-taster, to be struck in obliquely to the bottom.

Shower of BUTTER. Naturalists speak of showers and dews of a butyraceous substance. In 1695, there fell in Ireland, during the winter and ensuing spring, a thick yellow dew, which had the medicinal properties of butter.

BUTTER, among chemists, a name given to several preparations, on account of their consistence resembling that of butter; as butter of antimony, &c. See CHEMISTRY-Index.

BUTTER-Bur, in botany. See TUSSILAGO.

BUTTER-Milk, the milk which remains after the butter is come by churning. Butter-milk is esteemed an excellent food, in the spring especially, and is particularly recommended in hectic fevers. Some make curds of butter-milk, by pouring into it a quantity of new milk hot.

BUTTER-Wort, in botany. See PINGVICULA.

BUTTERFLY, the English name of a numerous genus of insects. See PAPILIO.

BUTTERFLY-Shell, in natural history. See VOLUTA.

Method of preserving BUTTERFLIES. See INSECT.

Method of making Pictures of BUTTERFLIES. "Take butterflies or field-moths, either those catch'd abroad, or such as are taken in caterpillars and nurs'd in the house till they be flies; clip off their wings very close to their bodies, and lay them on clean paper, in the form of a butterfly when flying; then have ready prepared gum arabic that hath been some time dissolved in water, and is pretty thick; if you put a drop of ox-gall into a spoonful of this, it will be better for the use; temper them well with your finger, and spread a little of it on a piece of thin white paper, big enough to take both sides of your fly; when it begins to be clammy under your finger, the paper is in proper order to take the feathers from the wings of the fly; then lay the gummed side on the wings, and it will take them up; then double your paper so as to have all the wings between the paper; then lay it on a table, pres-

sing it close with your fingers; and you may rub it gently with some smooth hard thing; then open the paper and take out the wings, which will come forth transparent: the down of the upper and under side of the wings, sticking to the gummed paper, form a just likeness of both sides of the wings in their natural shapes and colours. The nicety of taking off lies depends on a just degree of moisture of the gum'd paper: for if it be too wet, all will be blotted and confused; and if too dry, your paper will stick so fast together, that it will be torn in separation. When you have opened your gum'd papers, and they are dry, you must draw the bodies from the natural ones, and paint them in water-colours: you must take paper that will bear ink very well for this use; for making paper will separate with the rest, and spoil all."

BUTTERIS, in the manege, an instrument of steel, fitted to a wooden handle, wherewith they pare the foot, or cut off the hoof, of a horse.

BUTTOCK *of a SHIP*: that part of her which is her breadth right astern, from the tack upwards; and a ship is said to have a broad or a narrow buttock, according as she is built broad or narrow at the transum.

BUTTON, an article in dress, whose form and use are too well known to need description. They are made of various materials, as mohair, silk, horse-hair, metal, &c.

Method of making common BUTTONS. Common buttons are generally made of mohair; some indeed are made of silk, and others of thread; but the latter are of a very inferior sort. In order to make a button, the mohair must be previously wound on a hobbin; and the mould fixed to a board by means of a bodkin thrust through the hole in the middle of it. This being done, the workman wraps the mohair round the mould in three, four, or six columns, according to the button.

Horse-hair BUTTONS. The moulds of these buttons are covered with a kind of stuff composed of silk and hair; the warp being belladine silk, and the shoot horse-hair. This stuff is wove with two selvages, in the same manner and in the same loom as ribbands. It is then cut into square pieces proportional to the size of the button, wrapped round the moulds, and their selvages stitched together, which form the under part of the button.

Cleaning of BUTTONS. A button is not finished when it comes from the maker's hands; the superfluous hairs and hubs of silk must be taken off, and the button rendered glossy and beautiful before it can be sold. This is done in the following manner: A quantity of buttons are put into a kind of iron sieve, called by workmen a *singeing box*. Then a little spirit of wine being poured into a kind of shallow iron dish, and set on fire, the workman moves and shakes the singeing box, containing the buttons, briskly over the flame of the spirit, by which the superfluous hairs, hubs of silk, &c. are burnt off, without damaging the buttons. Great care, however, must be taken that the buttons in the singeing box be kept continually in motion; for if they are suffered to rest over the flame, they will immediately burn. When all these loose hairs, &c. are burnt off by the flame of the spirit, the buttons are taken out of the singeing box, and put, with a proper

Butteris

p. 122.

Furrow. quantity of the crumbs of bread, into a leather bag, about three feet long, and of a conical shape; the mouth or smaller end of which being tied up, the workman takes one of the ends in one hand and the other in the other, and shakes the hand briskly with a particular jerk. This operation cleanses the buttons, renders them very glossy, and fit for sale.

Gold-twist Buttons. The mould of these buttons is first covered in the same manner with that of common buttons. This being done, the whole is covered with a thin plate of gold or silver, and then wrought over of different forms, with purl and gimp. The former is a kind of thread composed of silk and gold-wire twisted together; and the latter, capillary tubes of gold or silver, about the tenth of an inch long. These are joined together by means of a fine needle, filled with silk, thrust through their apertures, in the same manner as beads or bugles.

The manner of making Metal-Buttons. The metal with which the moulds are intended to be covered is first cast into small ingots, and then flatted into thin plates or leaves, of the thickness intended, at the flattening mills; after which it is cut into small round pieces proportionable to the size of the mould they are intended to cover, by means of proper punches on a block of wood covered with a thick plate of lead. Each piece of metal thus cut out of the plate is reduced into the form of a button, by beating it successively in several cavities, or concave moulds, of a spherical form, with a convex punchon of iron, always beginning with the shallowest cavity or mould, and proceeding to the deeper, till the plate has acquired the intended form: and the better to manage so thin a plate, they form ten, twelve, and sometimes even twenty-four, to the cavities, or concave moulds, at once; often sealing the metal during the operation, to make it more ductile. This plate is generally called by workmen the *cap of the button*.

The form being thus given to the plates or caps, they strike the intended impression on the convex side, by means of a similar iron punchon, in a kind of mould engraven *en creux*, either by the hammer or the press used in coining. The cavity or mould, wherein the impression is to be made, is of a diameter and depth suitable to the sort of button intended to be struck in it; each kind requiring a particular mould. Between the punchon and the plate is placed a thin piece of lead, called by workmen a *bob*, which greatly contributes to the taking off all the strokes of the engraving; the lead, by reason of its softness, easily giving way to the parts that have relieve, and as easily insinuating itself into the traces or indentures.

The plate thus prepared makes the cap or shell of the button. The lower part is formed of another plate, in the same manner, but much flatter, and without any impression. To the tail or under plate is foldered a small eye made of wire, by which the button is to be fastened.

The two plates being thus finished, they are foldered together with soft folder, and then turned in a lathe. Generally indeed they use a wooden mould, instead of the under plate; and in order to fasten it, they pass a thread or gut across, through the middle of the mould, and fill the cavity between the mould and the cap with cement, in order to render the button firm and solid;

for the cement entering all the cavities formed by the relieve of the other side, sustains it, prevents its flattening, and preserves its hose or design.

Buttons, in the manege. Button of the reins of a bridle, is a ring of leather, with the reins passed thro' it, which runs all along the length of the reins. To put a horse under the button, is when a horse is stopped without a rider upon his back, the reins being laid on his neck, and the button lowered so far down that the reins bring in the horse's head, and fix it to the true posture or carriage. It is not only the horses which are managed in the hand that must be put under the button; for the same method must be taken with such horses as are laced between two pillars, before they are backed.

Button-Wood. See CEPHALANTHUS.

Button's-Bay, the name of the north part of Hudson's bay, in North America, whereby Sir Thomas Button attempted to find out a north-west passage to the East Indies. It lies between 80° and 100° west longitude, and between 60° and 66° north latitude.

Button-Stone, in natural history, a kind of figured stone, so denominated from its resembling the button of a garment. Dr Hook gives the figure of three sorts of button-stones, which seem to have been nothing else but the filling up of three several sorts of shells. They are all of them very hard flints; and have this in common, that they consist of two bodies, which seem to have been the filling up of two holes or vents in the shell. Dr Plot describes a species finely striated from the top, after the manner of some hair buttons. This name is also given to a peculiar species of slate found in the marquise of Bareith, in a mountain called *Fichtelberg*; which is extremely different from the common sorts of slate, in that it runs with great ease into glass in five or six hours time, without the addition of any salt or other foreign substance, to promote its vitrification, as other stones require. It contains in itself all the principles of glass, and really has mixed in its substance the things necessary to be added to promote the fusion of other stony bodies. The Swedes and Germans make buttons of the glass produced from it, which is very black and shining, and it has hence its name *button-stone*. They make several other things also of this glass, as the handles of knives and the like, and send a large quantity of it unwrought in round cakes as it cools from the fusion into Holland.

BUTTRESS, a kind of butment built archwise, or a mass of stone or brick, serving to prop or support the sides of a building, wall, &c. on the outside, where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c.—Buttresses are used against the angles of steeples and other buildings of stone, &c. on the outside, and along the walls of such buildings as have great and heavy roofs, which would be subject to thrust the walls out, unless very thick, if no buttresses were placed against them. They are also placed for a support and butment against the feet of some arches, that are turned across great halls in old palaces, abbeys, &c.

BUTUS (anc. geog.), a town of Lower Egypt, on the west side of the branch of the Nile, called *Ternuthiacus*; towards the mouth called *Offium Sebennyticum*: in this town stood an oracle of Latona, (Strabo, Herodotus). Ptolemy places Butus in the Nomos

Butzaw
||
Buxton.

B u x

Phthenotes: it is also called *Butz, ut*, (Herodotus, Stephanus). It had temples of Apollo and Diana, but the largest was that of Latona where the oracle stood.

BUTZAW, a town of lower Saxony, in Germany; it stands upon the river Varnow, on the road from Schwerin to Rollock, lying in E. Long. 13. 12. N. Lat. 54. 50.

—BUVETTE, or BEUVETTE, in the French laws, an established place in every court, where the lawyers and counsellors may retire, warm themselves, and take a glass of wine by way of refreshment, at the king's charge. There is one for each court of parliament, but these are only for persons belonging to that body; there are others in the *palais*, whither other persons also resort.

BUXENTUM, (Livy, Velleius, Ptolemy, Mela, Pliny); PYXUS, (Strabo, Pliny): a town of Lucania, first built by the people of Messana, but afterwards deserted, (Strabo). A Roman colony was sent thither, (Livy, Velleius): and when found still thin of inhabitants, a new colony was sent by a decree of the senate. Its name is from *buxus*, the box-tree, growing plentifully there. Strabo says, the name *Pyxus* includes a promontory, port, and river, under one. Now *Policastro*, in the Hither Principato of Naples. E. Long. 15. 40. N. Lat. 40. 20.

BUXTON, a place in the peak of Derbyshire, celebrated for its medicinal waters, and lying in W. Long. 0. 20. N. Lat. 53. 20.

It has been always believed by our antiquaries, that the Romans were acquainted with these wells, and had frequented them much, as there is a military way still visible, called the *Bath-gate*, from Burgh to this place. This was verified about 50 years ago, when Sir Thomas Delves, of Cheshire, in memory of a cure he received here, caused an arch to be erected; in digging the foundations for which, they came to the remains of a solid and magnificent structure of Roman workmanship; and in other places of the neighbourhood, very capacious leaden vessels, and other utensils, of Roman workmanship, have been discovered. These waters have always been reckoned inferior to those in Somersetshire; but seem never to have been totally disused. They are mentioned by Leland, as well known 200 years ago; but it is certain they were brought into greater credit by Dr Jones in 1572, and by George earl of Shrewsbury, who erected a building over the bath, then composed of nine springs. This building was afterwards pulled down, and a more commodious one erected at the expense of the earl of Devonshire. In doing this, however, the ancient register of cures drawn up by the bath-warden, or physician attending the baths, and subscribed by the hands of the patients, was lost.

The warm waters of Buxton are, the bath, consisting of nine springs, as already mentioned, St Ann's well, and St Peter's or Bingham well. St Ann's well rises at the distance of somewhat more than 52 yards north-east from the bath. It is chiefly supplied from a spring on the north side, out of a rock of black limestone or ballard marble. It formerly rose into a stone basin, shut up within an ancient Roman brick wall, a yard square within, a yard high on three sides, and open on the fourth. But, in 1709, Sir Thomas Delves, as already mentioned, erected an arch over it which still

continues. It is 12 feet long, and as many broad, set round with stone steps on the inside. In the middle of this dome the water now springs up into a stone basin two feet square. St Peter's or Bingham well rises about 20 yards south-east of St Ann's. It is also called *Leah's well*, from a remarkable cure received from it by a gentleman of that name. It rises out of a black limestone, in a very dry ground; and is not so warm as St Ann's well.

From the great resort of company to the waters, this place has grown into a large straggling town, which is daily increasing. The houses are chiefly, or rather solely, built for the reception of invalids; and many of them are not only commodious, but elegant. The duke of Devonshire has lately erected a most magnificent building in the form of a crescent, with piazzas, under which the company walk in wet or cold weather. It is divided into different hotels, shops, &c with a public coffee-room, and a very elegant room for assemblies and concerts.

The hot water resembles that of Bristol. It has a sweet and pleasant taste. It contains the calcareous earth, together with a small quantity of sea salt, and an inconsiderable portion of a purging salt; but no iron can be discovered in it. This water taken inwardly is esteemed good in the diabetes; in bloody urine; in the bilious cholick; in loss of appetite, and coldness of the stomach; in inward bleedings; in atrophy; in contraction of the vessels and limbs, especially from age; in cramps and convulsions; in the dry asthma without a fever; and also in barrenness. Inwardly and outwardly, it is said to be good in rheumatic and scorbatic complaints; in the gout; in inflammation of the liver and kidneys, and in consumptions of the lungs; also in old strains; in hard callous tumours; in withered and contracted limbs; in the itch, scabs, nodes, chalky swellings, ring-worms, and other similar complaints.—Besides the hot water, there is also a cold chalybeate water, with a rough stony taste: It resembles the Tunbridge water in virtues.

For the methods of composing artificial Buxton water, or of impregnating the original water with a greater quantity of its own gas or with other gases, see *WATERS (Medicinal)*.

BUXTON (Jedediah), a prodigy with respect to skill in numbers. His father, William Buxton, was schoolmaster of the same parish, where he was born in 1724; yet Jedediah's education was so much neglected, that he was never taught to write; and with respect to any other knowledge but that of numbers, seemed always as ignorant as a boy of ten years of age. How he came first to know the relative proportion of numbers, and their progressive denominations, he did not remember; but to this he applied the whole force of his mind, and upon this his attention was constantly fixed, so that he frequently took no cognizance of external objects, and when he did it, it was only with respect to their numbers. If any space of time was mentioned, he would soon after say it was so many minutes; and if any distance of way, he would assign the number of hours travelled, without any question being asked, or any calculation expected by the company. When he encountered a question, he began to work with amazing facility, after his own method, without the use of a pen, pencil, or chalk, or even understanding the common

Buxton,
Buxtorf.Buxtorf,
Buxus.

rules of arithmetic as taught in the schools. He would stride over a piece of land or a field, and tell you the contents of it almost as exact as if you had measured it by the chain. In this manner he measured the whole lordship of Elnton, of some thousand acres, belonging to Sir John Rhodes, and brought him the contents, not only in acres, roods, and perches, but even in square inches. After this, for his own amusement, he reduced them into square hair-breadths, computing 48 to each side of the inch. His memory was so great, that while resolving a question, he could leave off, and resume the operation again where he left off the next morning, or at a week, a month, or at several months, and proceed regularly till it was completed. His memory would doubtless have been equally retentive with respect to other objects, if he had attended to other objects with equal diligence; but his perpetual application to figures prevented the smallest acquisition of any other knowledge. He was sometimes asked, on his return from church, whether he remembered the text, or any part of the sermon, but it never appeared that he brought away one sentence; his mind, upon a closer examination, being found to have been busied, even during divine service, in his favourite operation, either dividing some time, or some space, into the smallest known parts, or resolving some question that had been given him as a test of his abilities.

This extraordinary person living in laborious poverty, his life was uniform and obscure. Time, with respect to him, changed nothing but his age; nor did the seasons vary his employment, except that in winter he used a flail, and in summer a ling-hook. In the year 1754, he came to London, where he was introduced to the royal society, who, in order to prove his abilities, asked him several questions in arithmetic, and he gave them such satisfaction, that they dismissed him with a handsome gratuity. In this visit to the metropolis, the only object of his curiosity, except figures, was his desire to see the king and royal family; but they being just removed to Kensington, Jedediah was disappointed. During his residence in London, he was taken to see King Richard III. performed at Drury-lane playhouse; and it was expected, either that the novelty and the splendor of the show would have fixed him in astonishment, or kept his imagination in a continual hurry, or that his passions would, in some degree, have been touched by the power of action, if he had not perfectly understood the dialogue. But Jedediah's mind was employed in the playhouse just as it was employed in every other place. During the dance, he fixed his attention upon the number of steps; he declared, after a fine piece of music, that the innumerable sounds produced by the instruments had perplexed him beyond measure; and he attended even to Mr Garrick, only to count the words that he uttered, in which he said he perfectly succeeded. Jedediah returned to the place of his birth, where, if his enjoyments were few, his wishes did not seem to be more. He applied to his labour, by which he subsisted with cheerfulness; he regretted nothing that he left behind him in London; and it continued to be his opinion, that a slice of rufy bacon afforded the most delicious repast.

BUXTORF (John), a learned professor of Hebrew at Basil, who, in the 17th century, acquired the highest reputation for his knowledge of the Hebrew and Chal-

dee languages. He died of the plague at Basil in 1629, aged 65. His principal works are, 1. A small but excellent Hebrew grammar; the best edition of which is that of Leyden in 1701, revised by Leusden. 2. A treasure of the Hebrew grammar. 3. An Hebrew concordance, and several Hebrew lexicons. 4. *Institutio epistolaris Hebraica*. 5. *De abbreviaturis Hebræorum*, &c.

BUXTORF (John), the son of the former, and a learned professor of the oriental languages at Basil, distinguished himself, like his father, by his knowledge of the Hebrew language, and his rabbinical learning. He died at Basil in 1664, aged 65 years. His principal works are, 1. His translation of the *Mora Novechim*, and the *Cozri*. 2. A Chaldee and Syriac lexicon. 3. An anticritic against Cappel. 4. A treatise on the Hebrew points and accents against the same Cappel.

BUXUS, the BOX-TREE: A genus of the tetrandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, *Triocœce*. The male calyx is triphyllous, the germen an embryo, or imperfect rudiment. The female calyx is tetraphyllous: there are three petals, and as many styles: the capsule three beaked and trilocular, with three seeds.

Species. 1. The arborefcens, with oval leaves. 2. The angustifolia, or narrow-leaved box. These two sorts grow in great plenty upon Boxhill near Dorking in Surry in England. Here were formerly large trees of that kind; but now they are much fewer in number. There are two or three varieties of the first sort which are propagated in gardens; one with yellow, and the other with white striped leaves. Another hath the tips of the leaves only marked with yellow, and is called *tipped box*. 3. The suffruticosa, dwarf, or Dutch box, commonly used for bordering of flower-beds.

Culture. The two first sorts may be raised from seeds; and may be also propagated by cuttings, which are to be planted in the autumn in a shady border. The best season for removing these trees is in October; though, if care be used to take them up with a good ball of earth, they may be transplanted almost at any time except the middle of summer. The dwarf box is increased by parting the roots, or planting the slips; but as it makes so great an increase of itself, and so easily parts, it is hardly worth while to plant the slips that have no roots.

Uses. The tree or large box is proper to intermix in clumps of evergreens, &c. where it adds to the variety of such plantations: they are a very great ornament to cold and barren soils where few other things will grow. The dwarf kind of box is used for bordering flower-beds, or other purposes of that nature; and for this it far excels any other plant, being subject to no injuries from cold or heat. It is of long duration; is easily kept handsome; and, by the firmness of its rooting, keeps the mould in the borders from washing into the gravel walks more effectually than any plant whatever.—Boxwood is extremely hard and smooth, and therefore well adapted to the use of the turner. Combs, mathematical instruments, knife-handles, and button-moulds, are made of it. It may properly enough be substituted in default of ebony, the yellow alburnum of which it perfectly resembles. In the Ephemerides of the curious there is the following account of the efficacy.

Buying
||
Buzet.

ficacy of boxwood in making hair grow. "A young woman of Gunberg in Lower Silesia, having had a malignant dyfentery which occasioned the falling off of all her hair, was advifed by a perfon, fome time after her recovery (as her hair was not likely to grow again of itfelf, her head being then as bare as the hand), to wash it all over with a decoction of boxwood; which he readily did, without the addition of any other drug. Hair of a chefnut colour grew on her head, as the was told it would do; but having ufed no precaution to fecure her neck and face from the lotion, they became covered with red hair to fuch a degree, that the feemed little different from an ape or a monkey." This decoction has been recommended by fome as a powerful fudorific, preferable even to guaiacum; but the tafte readily difcovers that it wants the qualities of that wood. Neither the wood nor the leaves of the box-tree at prefent are ufed for any other medicinal purpofe than the diftillation of an empyreumatic oil; and an oil of nearly the fame quality is obtained from almoft every other wood.

BUYING, the act of making a purchafe, or of acquiring the property of a thing for a certain price.

Buying ftands oppofed to felling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter is not. By the civil law, perfons are allowed to buy hope, *ſpem pretio emere*, that is, to purchafe the event or expectation of any thing. E. gr. The fiſh or birds a perfon ſhall catch, or the money he ſhall win in gaming.

There are different ſpecies of buying in uſe among traders; as, buying on one's own account, oppoſed to buying on commiſſion; buying for ready money, which is when the purchaſer pays in actual ſpecie on the ſpot; buying on credit, or for a time certain, is when the payment is not to be preſently made, but, in lieu thereof, an obligation given by the buyer for payment at a time future; buying on delivery, is when the goods purchaſed are only to be delivered at a certain time future.

Buying the refusal, is giving money for the right or liberty of purchaſing a thing at a fixed price, in a certain time to come; chiefly uſed in dealing for ſhares in ſtock. This is ſometimes alſo called by a cant name, *buying the bear*.

Buying the ſmall-pox, is an appellation given to a method of procuring that diſeaſe by an operation ſimilar to inoculation; frequent in South Wales, where it has obtained time out of mind. It is performed either by rubbing ſome of the *pus* taken out of a puſtule of a variolous perſon on the ſkin, or by making a puncture in the ſkin with a pin dipped in ſuch *pus*.

BUYS, a town of Dauphiny in France, ſituated on the borders of Provence. E. Long. 5. 20. N. Lat. 44. 25.

BUZANCOIS, a ſmall town of Berry in France, ſituated on the borders of Tourain, in E. Long. 1. 29. N. Lat. 46. 38.

BUZBACH, a town of Germany, in Weſteravia and the county of Holmes, one the confines of Hanau. E. Long. 10. 51. N. Lat. 50. 22.

BUZET, a ſmall town of France, in Languedoc, ſeated on the river Torne, in E. Long. 1. 45. N. Lat. 43. 47.

BUZZARD, in ornithology, the name of ſeveral ſpecies of the hawk kind. See **FALCO**.

BYBLUS, (anc. geog.) a town of Phœnicia, ſituated between Berytus and Botrys: it was the royal reſidence of Cinyras; ſacred to Adonis. Pompey delivered it from a tyrant, whom he cauſed to be beheaded. It ſtood at no great diſtance from the ſea, on an eminence, (Strabo): near it ran the Adonis into the Mediterranean. Now in ruins.

BYCHOW, a ſmall town of Lithuania in Poland, ſituated on the river Nieper, in E. Long. 30. 2. N. Lat. 53. 57.

BY-LAWS, are laws made *obiter*, or by the by; ſuch as orders and conſtitutions of corporations for the governing of their members, of court-leets, and courts baron; commoners, or inhabitants in vills, &c. made by common aſſent, for the good of thoſe that made them, in particular caſes whereunto the public law doth not extend; ſo that they bind farther than the common or ſtatute law: guilds and fraternities of trades by letters patent of incorporation, may likewiſe make by-laws for the better regulation of trade among themſelves or with others. In Scotland theſe laws are called laws of *birlaw*, or *burlaw*; which are made by neighbours elected by common conſent in the *birlaw courts*, wherein knowledge is taken of complaints betwixt neighbour and neighbour; which men ſo choſen are judges and arbitrators, and ſtyled *birlaw-men*. And birlaws, according to Skene, are *leges ruſticorum*, laws made by huſbandmen, or townſhips, concerning neighbourhood among them. All by-laws are to be reaſonable, and for the common benefit, not private advantage of particular perfons, and muſt be agreeable to the public laws in being.

BYNG (George), lord viſcount Torrington, was the ſon of John Byng, Eſq; and was born in 1663. At the age of 15, he went volunteer to ſea with the king's warrant. His early engagement in this courſe of life gave him little opportunity of acquiring learning or cultivating the polite arts; but by his abilities and activity as a naval commander he furniſhed abundant matter for the pens of others. After being ſeveral times advanced, he was in 1702 raiſed to the command of the Naſſau, a third rate, and was at the taking and burning the French fleet at Vigo; and the next year he was made rear-admiral of the red. In 1704, he ſerved in the grand fleet ſent to the Mediterranean under Sir Cloudely Shovel, as rear-admiral of the red; and it was he who commanded the ſquadron that attacked, cannonaded, and reduced Gibraltar. He was in the battle of Malaga, which followed ſoon after; and for his behaviour in that action queen Anne conferred on him the honour of knighthood. In 1705, in about two months time, he took 12 of the enemies largeſt privateers, with the *Thetis*, a French man of war of 44 guns; and alſo ſeveral merchant ſhips, moſt of them richly laden. The number of men taken on board was 2070, and of guns 334. In 1718, he was made admiral and commander in chief of the fleet; and was ſent with a ſquadron into the Mediterranean for the protection of Italy, according to the obligation England was under by treaty, againſt the invaſion of the Spaniards; who had the year before ſurpriſed Sardinia, and had this year landed an army in Sicily. In this expedition he diſpatched captain Walton in the *Cantebury*, with five more ſhips in

Buzzard

Byrom.

pursuit of six Spanish men of war, with galleys, fire-ships, bomb-vessels, and store-ships, who separated from the main fleet, and stood in for the Sicilian shore. The captain's laconic epistle on this occasion is worthy of notice; which showed that fighting was his talent as well as his admirals, and not writing.

" Sir,

" We have taken and destroyed all the Spanish ships and vessels which were upon the coast, as per margin.

Canterbury, off Syracuse,

" I am, &c.

August 16th, 1718.

G. Walton."

From the account referred to, it appeared that he had taken four Spanish men of war, with a bomb-vessel and a ship laden with arms; and burned four, with a fire-ship and bomb-vessel. The king made the admiral an handsome present, and sent him plenipotentiary powers to negotiate with the princes and states of Italy as there should be occasion. He procured the emperor's troops free access into the fortresses that still held out in Sicily; sailed afterwards to Malta, and brought out the Sicilian galleys, and a ship belonging to the Turkey company. Soon after he received a gracious letter from the emperor Charles VI. written with his own hand, accompanied with a picture of his imperial majesty, set round with very large diamonds, as a mark of the grateful sense he had of his services. It was entirely owing to his advice and assistance that the Germans retook the city of Messina in 1719, and destroyed the ships that lay in the bay; which completed the ruin of the naval power of Spain. The Spaniards being much distressed, offered to quit Sicily; but the admiral declared, that the troops should never be suffered to quit the island till the king of Spain had acceded to the quadruple alliance. And to his conduct it was entirely owing that Sicily was subdued, and his Catholic majesty forced to accept the terms prescribed him by the quadruple alliance. After performing so many signal services, the king received him with the most gracious expressions of favour and satisfaction; made him rear-admiral of England and treasurer of the navy, one of his most honourable privy-council, baron Byng of Southill in the county of Bedford, viscount Torrington in Devonshire, and one of the knights companions of the Bath upon the revival of that order. In 1727, George II. on his accession to the crown, placed him at the head of his naval affairs, as first lord commissioner of the admiralty; in which high station he died January 15th 1733, in the 70th year of his age, and was buried at Southill in Bedfordshire.

BYNG (the honourable George), Esq: the unhappy son of the former, was bred to sea, and rose to the rank of admiral of the blue. He gave many proofs of courage; but was at last shot, upon a dubious sentence for neglect of duty, in 1757. See BRITAIN, N 433.

BYRLAW or *EURLAW-Larus* in Scotland. See BY-LAWS.

BYROM (John), an ingenious poet of Manchester, born in 1691. His first poetical essay appeared in the Spectator, N^o 603, beginning, " My time, O ye muses, was happily spent;" which, with two humorous letters on dreams, are to be found in the eighth volume. He was admitted a member of the royal society in 1724; and having originally entertained thoughts of practising physic, to which the title of *doctor* is incident, that was

the appellation by which he was always known: but reducing himself to narrow circumstances by a precipitate marriage, he supported himself by teaching a new method of writing short-hand, of his own invention; until an estate devolved to him by the death of an elder brother. He was a man of lively wit; of which, whenever a favourable opportunity tempted him to indulge it, he gave many humorous specimens. He died in 1763; and a collection of his Miscellaneous poems was printed at Manchester, in 2 vols 8vo. 1773.

BYRRHUS, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are clavated, pretty solid, and a little compressed. There are five species, all of which are to be found on particular plants; and principally distinguished from one another by the colour and figure of the elytra, or crustaceous wing-cases.

The byrrhus seropulariæ, which is very common upon flowers, it is very hard to describe properly. Its body is almost oval; the ground colour black; but the under part of the abdomen appears almost entirely white, owing to an infinite number of minute scales, of that colour with which it is covered. The head is small, and often drawn back under the thorax, which latter is broad, covered with white and reddish scales, through which the black ground in some places appears. The elytra are bent in, and even rather inclose the sides and under part of the body. They are black, with white and red scales, which form a kind of embroidered work. First, there is observable a white transverse stripe, somewhat broad on the top of the elytra; at the bottom of them, there are two white distinct spots near the future, one upon each elytrum. The ruddy colour occupies chiefly the lower end of the future of the elytra, and the upper part of them, near their connection with the thorax. This species is common in gardens. If rubbed, the small coloured scale comes off, and the insect appears almost entirely black.

The Byrrhus verbascei is much smaller than the preceding species; its figure and form are however the same; only that the scales which cover the elytra are more numerous and closer set, so that the black colour, which constitutes the ground of the elytra, is no where to be seen. The scales form three stripes, white, transverse, and undulated, between which intervene stripes of a reddish brown shaped in the same manner. They are sometimes to be met with stripped of part of their scales, which renders them so different as not to be known for the same creatures. The larvæ of this insect, as also those of the preceding species, are extremely voracious, and much resemble those of the dermeitæ. People who collect subjects of natural history, are greatly pestered, and but too well acquainted with them.

BYSSUS, in botany: A genus of the 57th natural order, viz. *Alga*, belonging to the cryptogamia class of plants. It has a *down*, or very fine uniform powder. The character is taken from this circumstance, that they are covered with a simple capillary filament or down, resembling soft dust. There are 15 species, all natives of Britain, growing upon rotten wood, old walls, &c.

Byssus, or *Byssum*, a fine thready matter produced

Byrrhus,
Byssus.

in India, Egypt, and about Elis in Achaia, of which the richest apparel was anciently made, especially that wore by the priests both Jewish and Egyptian. Some interpreters render the Greek *βύσσος*, which occurs both in the Old and New Testament, by *fine linen*. But other versions, as Calvin's, and the Spanish printed at Venice in 1556, explain the word by *silk*; and yet byssus must have been different from our silk, as appears from a multitude of ancient writers, and particularly from Jul. Pollux. M. Simon, who renders the word by fine linen, adds a note to explain it; viz. "that there was a fine kind of linen very dear, which the great lords alone wore in this country as well as in Egypt." This account agrees perfectly well with that given by Hesychius, as well as what is observed by Bochart, that the byssus was a finer kind of linen, which was frequently dyed of a purple colour. Some authors will have the byssus to be the same with our cotton; others take it for the *linum asofsinum*; and others for the lock or bunch of silky hair found adhering to the pinna marina, by which it fastens itself to the neighbouring bodies. Authors usually distinguish two sorts of byssus; that of Elis; and that of Judæa, which was the finest. Of this latter were the priestly ornaments made. Bonfrerius notes, that there must have been two sorts of byssus, one finer than ordinary, by reason there are two Hebrew words used in Scripture to denote byssus; one of which is always used in speaking of the habit of the priests, and the other of that of the Levites.

Brassæ Aßeslinus, a species of asbellus or incombustible flax, composed of fine flexible fibres parallel to one another. It is found plentifully in Sweden, either white, or of different shades of green. At a copper mine in Westmannland it forms the greatest part of the vein out of which the ore is dug; and by the heat of the furnace which smelts the metal, is changed into a pure semitransparent slag or glass.

BYZANTIUM, an ancient city of Thrace, situated on the Bosphorus. It was founded, according to Eusebius, about the 30th Olympiad, while Tullus Hostilius reigned in Rome. But according to Diodorus Siculus, the foundations of this metropolis were laid in the time of the Argonauts, by one Byfas, who then reigned in the neighbouring country, and from whom the city was called *Byzantium*. This Byfas, according to Eustathius, arrived in Thrace a little before the Argonauts came into those seas, and settled there with a colony of Megarenæes. Velleius Paterculus ascribes the founding of Byzantium to the Milesians, and Ammianus Marcellinus to the inhabitants of Attica. Some ancient medals of Byzantium, which have reached our times, bear the name and head of Byfas, with the prow of a ship on the reverse. The year after the destruction of Jerusalem by Titus, Byzantium was reduced to the form of a Roman province. In the year 193 this city took part with Niger against Severus. It was strongly garrisoned by Niger, as being a place of the utmost importance. It was soon after invellied by Severus; and as he was universally hated on account of his cruelty, the inhabitants defended themselves with the greatest resolution. They had been supplied with a great number of warlike machines, most of them invented and built by Perifcus a native of Nicæa, and the greatest engineer of his age. For a long time they

baffled all the attempts of the assailants, killed great numbers of them, crushed such as approached the walls with large stones; and when stones began to fail, they used the statues of their gods and heroes. At last they were obliged to submit, through famine, after having been reduced to the necessity of devouring one another. The conqueror put all the magistrates and soldiers to the sword; but spared the engineer Perifcus. Before this siege, Byzantium was the greatest, most populous, and wealthiest city of Thrace. It was surrounded by walls of an extraordinary height and breadth; and defended by a great number of towers, seven of which were built with such art, that the least noise heard in one of them was immediately conveyed to all the rest. Severus, however, no sooner became master of it, than he commanded it to be laid in ashes. The inhabitants were stripped of all their effects, publicly sold for slaves, and the walls levelled with the ground. But by the chronicle of Alexandria we are informed, that soon after this terrible catastrophe, Severus himself caused a great part of the city to be rebuilt, calling it *Antonina*, from his son Caracalla, who assumed the surname of *Antoninus*. In 262, the tyrant Gallienus wreaked his fury on the inhabitants of Byzantium. He intended to besiege it; but on his arrival, despairing of being able to make himself master of such a strong place. He was admitted the next day, however, into the city; and without any regard to the terms he had agreed to, caused the soldiers and all the inhabitants to be put to the sword. Trebellius Pollio says, that not a single person was left alive. What the reason was for such an extraordinary massacre, we are no where informed. In the wars between the emperors Licinius and Maximin, the city of Byzantium was obliged to submit to the latter, but was soon after recovered by Licinius. In the year 323, it was taken from Licinius by Constantine the Great, who in 330 enlarged and beautified it, with a design to make it the second, if not the first, city in the Roman empire. He began with extending the walls of the ancient city from sea to sea; and while some of the workmen were busied in rearing them, others were employed in raising within them a great number of stately buildings, and among others a palace no way inferior in magnificence and extent to that of Rome. He built a capital and amphitheatre, made a circus maximus, several forums, porticoes, and public baths. He divided the whole city into 14 regions, and granted the inhabitants many privileges and immunities. By this means Byzantium became one of the most flourishing and populous cities of the empire. Vast numbers of people flocked thither from Pontus, Thrace, and Asia, Constantine having by a law, enacted this year (330), decreed, that such as had lands in those countries should not be at liberty to dispose of them, nor even leave them to their proper heirs at their death, unless they had an house in his new city. But however desirous the emperor was that his city should be filled with people, he did not care that it should be inhabited by any but Christians. He therefore caused all the idols to be pulled down, and all their churches consecrated to the true God. He built besides an incredible number of churches, and caused crosses to be erected in all the squares and public places. Most of the buildings being finished, it was solemnly dedicated

Byzantium, to the Virgin Mary, according to Cedrenus, but, according to Eusebius, to the God of Martyrs. At the same time Byzantium was equalled to Rome. The same rights, immunities, and privileges, were granted to its inhabitants as to those of the metropolis. He established a senate and other magistrates, with a power and authority equal to those of old Rome. He took up his residence in the new city; and changed its name to CONSTANTINOPLE.

BZOVIVS (Abraham), one of the most celebrated

writers in the 17th century, with respect to the astonishing number of pieces composed by him. His chief work is the continuation of Baronius's annals. He was a native of Poland, and a Dominican friar. Upon his coming to Rome, he was received with open arms by the Pope, and had an apartment assigned him in the Vatican. He merited that reception, for he has imitated Baronius to admiration in his design of making all things conspire to the despotic power and glory of the papal see. He died in 1637, aged 70.

END OF THE THIRD VOLUME.

ERRATA in ASTRONOMY, Vol. II. Part II.

The following omissions and mistakes in the Plates and References the Reader will be pleased to rectify with his pen.

Page 531. col. 1. under N^o 367. l. 8: of the paragraph: For 4, write 194.

In fig. 156. (Plate LXXV.), *y* is wanting at the Sun's place, and C at the centre of the Earth.

P. 550. margin. For 157, 158, write 30, 31.

P. 556. l. 21. from bottom. For fig. 204 write 205. In the figure itself, the circle most to the left hand wants N at the North Pole, and $\mathcal{A}E$ at one extremity of the Equator. The circle next to it wants likewise N at the North Pole, and $\mathcal{A}Q$ at the Equator, represented there by a double arch of a circle. S is wanting at the southern extremity of the axis, and T at the extremity of the Tropic of Cancer, represented by a black single arch of a circle. In the next circle Q is wanting at the right-hand extremity of the Equator, represented there by a double straight line. And in the fourth circle to the right hand, Q ought to be substituted in the place of O at the right-hand extremity of the Equator.

P. 580. N^o 489, line 1. For fig. 209, write 210.

P. 581. col. 1. middle. For fig. 210, wr. 211.

Ib. col. 2. For 211, wr. 212; and for 209, wr. 210.

P. 584. col. 2. middle. For 217, wr. 216.

P. 585. col. 1. For fig. 218, wr. 217.

Ibid. col. 2. For fig. 218, wr. 217; and for 217, wr. 216.
